Queensland Floods Commission of Inquiry

Statement of John Ruffini

Vol 1

January 2012

QFCI

Date:

6/2/12

JM

Exhibit Number:

1078

DERM

QUEENSLAND FLOODS
COMMISSION OF INQUIRY

STATEMENT OF JOHN LAWRENCE RUFFINI NO. 3

I, **JOHN LAWRENCE RUFFINI** of c/- 41 Boggo Road, EcoSciences Precinct, Dutton Park, Brisbane Queensland, Director, Water Planning Sciences Branch, Environment and Resource Science Division, Operations and Environmental Regulator Business Group, Department of Environment and Resource Management ("DERM"), make oath and state as follows:

Requirement from Queensland Floods Commission of Inquiry

1. I have seen a copy of a letter dated 25 January 2011 (attachment **JLR-17**), from the Commissioner, Queensland Floods Commission of Inquiry (the 'Commission') to me requiring a written statement under oath or affirmation, which is attachment **JLR-17** ("Requirement") and which details the topics my statement should cover.

Previous statements and role

2. I have previously provided 2 sworn statements to the Commission dated 24 March 2011 and 17 May 2011.
3. Paragraphs 17 to 20 of my statement dated 24 March 2011 provides details of my current role and employment at DERM.
4. Paragraphs 21 to 27 of that statement provides details of my duties as a Flood Operations Engineer.
5. I have also previously attended an interview conducted by Ms Lisa Hendy and Ms Susan Hedge of the Queensland Floods Commission of Inquiry on 29 March 2011 at 10:00am in relation to matters concerning the operation of Wivenhoe and Somerset Dams. Relevant extracts from the transcript of this interview discussing my involvement in the preparation of the *January 2011 Flood Event: Report on the Operation of Somerset Dam and Wivenhoe Dam: 2 March 2011* is attached at attachment **JLR-18**.

Involvement in the creation of the following parts of the January 2011 Flood Event: Report on the Operation of Somerset Dam and Wivenhoe Dam, 2 March 2011:

Item 1: Executive Summary

6. My involvement in relation to the creation of the Executive Summary to the *January 2011 Flood Event: Report on the Operation of Somerset Dam and Wivenhoe Dam: 2 March 2011* (the "Report") primarily involved reading,

reviewing and endorsing that the contents accurately reflected the operations of Somerset and Wivenhoe Dams during the January 2011 flood events.

7. I reviewed the Executive Summary in various draft forms during the creation of the Report prior to its release in early March 2011. There was one master copy of the Report (which was broken up into the various parts) saved on the computer server at the Flood Control Centre however, the Executive Summary was continuously updated and revised as parts of the Report were completed. The Executive Summary (as well as other parts of the Report) could only be opened and edited by one person at any one time but I recall that parts of the document could be opened by multiple persons at the same time for viewing purposes only. I am unsure of the specific dates or times which I reviewed and provided input into the Executive Summary however, I did provide some comments and edits to the Executive Summary for consideration. I do not recall specifically the edits, comments or additions made at the time.
8. The writing, reviewing and editing process of the Report was primarily conducted in the Flood Control Centre. I would either be provided with a hard copy of the current version of the Executive Summary which I would annotate with edits, additions or comments or alternatively, edits were made in track changes mode on the master version of the various parts of the Report and saved electronically for consideration by the primary author/editor. Any hard copies of the Executive Summary containing edits or comments would be provided back to the primary author/editor for consideration by being placed in a physical box located at the Flood Control Centre.
9. I did not keep copies of any comments I made in reviewing the Report as Seqwater's processes for editing the report was generally confined to within the Flood Control Centre.
10. Seqwater may have saved progressive draft versions of the Report and its various parts electronically.
11. I was not the primary author/editor of the Executive Summary to the Report however I reviewed and endorsed that its contents were accurate to my knowledge at the time of its completion.

Item 2: Part 2 – Flood Event Summary

12. My involvement in relation to the creation of Part 2 – Flood Event Summary ("Part 2") to the Report primarily involved reading, reviewing and endorsing that the contents accurately reflected the operation of Somerset and Wivenhoe Dams during the January 2011 flood events.
13. I reviewed Part 2 in various draft forms during the creation of the Report similar to my review of the Executive Summary described above.
14. I primarily focussed my review of Part 2 on the flood event summaries provided for the periods that I was rostered on as a Duty Flood Operations Engineer. The

periods which I was rostered on is detailed at pages 35-36 of the Report however, these periods were:

- Friday 7/1/11 from 7:00 PM to Saturday 8/1/11 7:00 AM
 - Sunday 9/1/11 from 7:00 PM to Monday 10/1/11 7:00 AM
 - Monday 10/1/11 from 7:00 PM to Tuesday 11/1/11 7:00 AM
 - Tuesday 11/1/11 from 7:00 PM to Wednesday 12/1/11 7:00 AM
 - Tuesday 11/1/11 - assisted from 1:00 PM to 7:00 PM
 - Wednesday 12/1/11 from 7:00 PM to Thursday 13/1/11 7:00 AM
 - Saturday 15/1/11 from 7:00 PM to Sunday 7:00 AM
 - Monday 17/1/11 from 7:00 AM to 7:00 PM
15. Although these were the periods which I had direct knowledge of in relation to the operations of Somerset and Wivenhoe Dams, I also reviewed the other Flood Event Summaries but this was done without the benefit of having been present at the Flood Control Centre during those periods.
16. I provided comments and edits to Part 2 of the Report for the primary author/editor's consideration however I do not recall specifically the edits, comments or additions I made at the time however, the edits, comments or additions were provided to the primary author/editor for consideration as per para 8 above.
17. I did not keep any copies of my comments made to Part 2 as Seqwater's processes for making any edits, amendments or comments was generally confined to within the Flood Control Centre.
18. As previously mentioned at para 9, Seqwater may have saved progressive draft versions of the Report, including Part 2, electronically.
19. I was not the primary author/editor of Part 2 to the Report however I reviewed and endorsed that its contents were accurate to my knowledge at the time of its completion.

Item 3: Part 10 – Flood Management Strategies and Manual Compliance

20. My involvement in relation to the creation of Part 10 – Flood Management Strategies and Manual Compliance ("Part 10") to the Report primarily involved reading, reviewing and endorsing that the contents accurately reflected the flood management strategies and the objectives of the Manual as well as compliance with the Manual and its strategies.
21. I reviewed Part 10 in various draft forms during the creation of the Report similar to my review of the Executive Summary and Part 2 detailed above.
22. Similar to para 13 above, I primarily focussed my review of Part 10 to the periods that I was rostered on as a Duty Flood Operations Engineer (Please refer to para 13 for the relevant periods).

23. I provided comments and edits to Part 10 for the primary author/editor's consideration however I do not recall specifically the details of the edits, comments or additions I made at the time.
24. Similar as for Items 1 and 2, I did not keep copies of any comments made to Part 10 however, as mentioned at para 9, Seqwater may have saved progressive draft versions of the Report, including Part 10, electronically.
25. I was not the primary author/editor of Part 10 to the Report however I reviewed and endorsed that its contents were accurate to my knowledge at the time of its completion.

Item 4: Part 19 – Report Conclusions

26. My involvement in relation to the creation of the Part 19 – Report Conclusions (“Part 19”) to the Report primarily involved reading, reviewing and endorsing that the contents accurately reflected the conclusions drawn from the Report.
27. I reviewed Part 19 in various draft forms during the creation of the Report similar to my review of the Executive Summary detailed above at para 7 however, I cannot recall whether or not I made any edits, corrections, amendments or comments to Part 19.
28. Similar to Items 1, 2 and 3, I did not keep copies of my comments made to Part 19, however, as previously mentioned at para 9, Seqwater may have saved progressive draft versions of the Report, including Part 19, electronically.
29. I was not the primary author/editor of Part 19 to the Report however I reviewed and endorsed that its contents were accurate to my knowledge at the time of its completion.

Additional Attachments

30. In response to the third dot point of the Requirement under “The Statement should be accompanied by:”, I did on a few occasions take an electronic copy of a draft version of the Report home for my perusal. This was primarily due to the tight timeframes under the Manual for producing the Report. Attachment **JAL-19** and **JAL-20** are copies of draft Reports that I recently located as part of complying with this Requirement. These copies contain edits in track changes mode in progress that were yet to be approved by the primary author/editor. I note that any edits, changes or amendments proposed were brought back to the Flood Control Centre where they were considered in accordance with the processes in the Flood Control Centre.

I make this solemn declaration conscientiously believing the same to be true, and by virtue of the provisions of the *Oaths Act 1867*.

Signed

John Lawrence Ruffini

Taken and declared before me, at Brisbane this 30th day of January 2012

.....
Solicitor/~~Barrister~~/Justice of the
Peace/~~Commissioner for Declarations~~

Our ref: Doc 1835409

25 January 2012

Mr John Ruffini
Flood Operations Engineer
Department of Environment and Resource Management
GPO Box 2454
BRISBANE QLD 4000

REQUIREMENT TO PROVIDE STATEMENT TO COMMISSION OF INQUIRY

I, Justice Catherine E Holmes, Commissioner of Inquiry, pursuant to section 5(1)(d) of the *Commissions of Inquiry Act 1950* (Qld), require Mr John Ruffini to provide a written statement, under oath or affirmation, to the Queensland Floods Commission of Inquiry, in which the said Mr John Ruffini gives an account of his involvement in the creation of the following parts of the January 2011 Flood Event Report on the Operation of Somerset Dam and Wivenhoe Dam, 2 March 2011 (Exhibit 24):

1. Executive Summary
2. Part 2 – Flood Event Summary
3. Part 10 – Flood Management Strategies and Manual Compliance
4. Part 19 – Report Conclusions

The statement should include but not be limited to an explanation as to when and how any parts of the report were:

5. written by him
6. contributed to by him
7. reviewed by him
8. endorsed by him, or
9. were the subject of any suggestion from him as to correction, amendment, addition or
10. the subject of any comment from him.

The statement should be accompanied by:

- any drafts of any part of the flood event report listed in 1. to 4. above that were written by him
- any document, in any form (for example, electronic, hard copy), which records any comments, corrections, amendments, additions or endorsements made by him
- any document which contains comments directed specifically to those parts of the report listed in 1. to 4. above, including documents which contain comments that might apply to those parts because they indicate any sort of opinion about the flood event report in its entirety.

In addressing these matters, Mr John Ruffini is to:

- provide all information in his possession and identify the source or sources of that information;
- make commentary and provide opinions he is qualified to give as to the appropriateness of particular actions or decisions and the basis of that commentary or opinion.

Mr John Ruffini may also address other topics relevant to the Terms of Reference of the Commission in the statement, if he wishes.

The statement is to be provided to the Queensland Floods Commission of Inquiry by 4pm, Monday 30 January 2012.

The statement can be provided by post, email or by arranging delivery to the Commission by emailing info@floodcommission.qld.gov.au.

Commissioner
Justice C E Holmes

MS HENDY: We might have another break. I don't know if you want to have a longer break to eat and then we can keep going.

A. No, it's right. Keep going.

MS HENDY: We'll just have another break for 10 minutes. So what time is it now, Susan?

MS HEDGE: It's currently 10 past, nine past on my watch.

MS HENDY: So we'll just start again at 20 past.

SHORT ADJOURNMENT

MS HENDY: This is an interview with John Ruffini just continuing at 12.20 and just for the purposes of the reporter I just note Mr Jeff rolls has left the interview. Everyone else who was here earlier is still here.

Q. John, I was just going to - unless you've got anything else you want to say on the topics we've been discussing I'll just now move on to the actual event summary and the event log to run through that?

A. Sure. As I said I mean - I guess the only thing I'd say there's a fair bit of misinformation out there, so it just sort of - and I haven't gone through an exercise of going in detail about this is wrong, that's wrong, this is different and whatever, rather it's focussing on saying our view about - this is why we think it's the way it is but there is just no need for this - there is a lot of stuff out there that isn't - that is just not right.

Q. First of all, I might just ask you about the actual - the January '11 flood event report on the operation of Somerset dam and Wivenhoe dam dated 2 March 2011?

A. Sure.

Q. And about the process of compiling that. Was that primarily written by John Tibaldi?

A. The way it worked, the process was that John - John did a lot of the writing legwork. Rob and Terry did a lot of the modelling, reporting side of things, and I kind of reviewed the critical bits and pieces as needed. I wasn't able to put in as much time as the other guys unfortunately because I had - one of the group's I manage out at Rocklea that site was flooded so there was quite a bit of - and I

1 had to do quite a bit of work because we had to get the
2 repaired stations up and running, so there was a bit -
3 initially I had to sort of deal with that for a little bit
4 of time with it, so I didn't quite spend as much time.
5 They had - some of the other Seqwater staff assisting and
6 just the --

7
8 Q. The background information?

9 A. Background, like putting tables together and they had
10 some people help them formatting and that sort of thing as
11 well but for the critical bits of the report which is like
12 going through - going through the flood event summary
13 stuff, I've been through pretty well, and through the
14 compliance with the manual stuff, we've been through that
15 pretty well, and I've been through the main body of the
16 text with it. The appendices, not as much. I've been
17 through what I could with them but I didn't - you know,
18 there well could be little errors and things like that
19 there. It's a big document.

20
21 Q. We'll just start moving through the flood event
22 summary?

23 A. Okay.

24
25 Q. So just starting at period 1 of 20 on page 10?

26 A. Yes.

27
28 Q. You're the duty engineer that was called back early
29 from holidays to assist with the management of the event,
30 is that you?

31 A. No, that was Terry. Terry was the on call duty
32 engineer during the period and Terry came back and started
33 off the event. Where is it? There's a roster.

34
35 Q. I have seen it somewhere?

36 A. There's a roster there which sort of goes through
37 exactly who was on.

38
39 Q. When?

40 A. Who was on where. It tended to - yes, it tended to be
41 - I think - I'd have to look it up exactly which one I was
42 first on with, but yes.

43
44 Q. Sure. And you were - later in the event I was just
45 curious about why you were rostered on with Rob Ayre given
46 that you and he seem to be the most senior. Is there some
47 reason for that?

EXECUTIVE SUMMARY

Somerset Dam and Wivenhoe Dam are located in the Brisbane River Basin. The Dams are dual purpose storages that provide urban water supplies (including drinking water) to South East Queensland as well as flood mitigation benefits to areas impacted by flood flows along the Brisbane River below Wivenhoe Dam.

In the 25 days prior to Thursday 6 January 2011, above-average levels of rainfall were received in the Dam catchment areas and the Dams successfully operated as flood mitigation dams on a number of occasions during this period. Further rain fell in the Dam catchments on Thursday 6 January 2011 leading to another mobilisation of Seqwater's Flood Operations Centre. The rainfall continued in various parts of the Brisbane River Basin until Wednesday 12 January 2011, resulting in the largest inflows into both Dams ever recorded. During this time, and for a period following the peak of the floods, the Dams were operated as flood mitigation storages in accordance with *The Manual of Operational Procedures for Flood Mitigation at Wivenhoe Dam and Somerset Dam (Revision 7)* ("the Manual"). The Manual defines the objectives and procedures for operating Somerset Dam and Wivenhoe Dam during flood events. An understanding of the Manual is important when reading this Report.

Deleted: four weeks

This Flood Event that impacted the Dams between Thursday 6 January 2011 and Wednesday 10 January 2011 can be defined in the range of large (1 in 100 years) to rare (1 in 2,000 years) in accordance with *Australian Rainfall and Runoff (Book 6) (AR&R)*. Studies associated with the design and operation of Wivenhoe Dam that date back to 1971, indicate a flood of this magnitude would be expected to result in urban damage below Moggill. The *Wivenhoe - Somerset Interaction Study* which was prepared to support the 2009 review of the Manual, is the most recent investigation undertaken that supports this expectation.

Deleted: that

Deleted: ¶

Background

Flood events that impact Somerset Dam and Wivenhoe Dam are caused by rainfall events that vary in intensity, duration and distribution over a catchment area exceeding 7,000km² above the Dams. When making decisions about releasing water from the Dams during flood events, consideration is also given to rain falling in Brisbane River catchment areas not controlled by the Dams. These catchment areas, which include the Lockyer Creek and Bremer River catchments, also cover an area in the order of 7,000km² and rain falling in these catchments will also vary in intensity, duration and distribution. Accordingly, the Manual must account for an infinite number of flood event scenarios.

The current level of forecasting technology does not make it possible for the Bureau of Meteorology (BoM) to provide completely accurate rainfall forecasts for the Dam catchment areas. A degree of uncertainty exists in all weather forecasts and the further forward in time forecasts are provided, the greater the degree of uncertainty.

Deleted: there is

As it is not possible to provide a specific procedure for Dam operation during every possible flood event, the Manual takes the approach of providing objectives and strategies to guide operational decision-making during a flood event. The objective followed and strategy chosen at any point in time depends on the actual water levels in the Dams, as well as flood modelling predictions based on the best observed and forecast rainfall and stream flow information available at the time.

It is not possible to predict the range of objectives and strategies that will be used during the course of a flood event, before or at any time during the event, prior to the event peak. Objectives and strategies change as flood events progress, as rainfall is received in the catchment and as forecast rainfall amounts change. For small floods, objectives and strategies relate to minimising flood impacts in rural areas, while as the scale of the flood increases, the emphasis changes to protecting urban areas and maintaining the structural safety of the Dam.

The primary objectives of the Manual, in order of importance, are:

- Ensure the structural safety of the Dams;
- Provide optimum protection of urbanised areas from inundation;
- Minimise disruption to rural life in the valleys of the Brisbane and Stanley Rivers;
- Retain the storage at Full Supply Level (FSL) at the conclusion of the flood event;

EXECUTIVE SUMMARY

- Minimise impacts to riparian flora and fauna during the drain down phase of the flood event.

While ensuring the Dams are operated during flood events within these objectives, Seqwater's duty of care to the public is also a primary consideration when making flood releases from the Dams. Every attempt is made to ensure public roads are closed prior to inundation by Dam outflows and that authorities are provided with enough time to prepare for community isolations and to undertake evacuations. Every attempt is also made to ensure urban damage is minimised, and that Dam outflows with the potential to contribute to urban damage are delayed until it is apparent no other options are available without risking the safety of the Dams.

Deleted: always operating

It is also important to note that, under the Manual's current operating rules, both Somerset Dam and Wivenhoe Dam are expected to fail during the Probable Maximum Flood, if such an event ever occurs.

Significance of the January 2011 Flood Event

Deleted: ¶

The January 2011 Flood Event has been defined as a large to rare event by AR&R, The Institution of Engineers Australia (Engineers Australia) national guidelines for the estimation of design flood characteristics. The flood level classifications adopted by BoM define the Event as a major flood. Relevant statistics that demonstrate this are:

Deleted: categorised as a rare event

Deleted: , as

Deleted: defined in

Deleted: Australian Rainfall and Runoff

Deleted: the Institution of Engineers

Deleted: and as a major flood, according to the f

Deleted: C

- Rainfall recorded in the catchment area above Wivenhoe Dam indicates that the catchment average rainfall intensity for the 72 hour period to Tuesday 11 January 2011 at 19:00 had an annual recurrence interval of between 1 in 100 years and 1 in 200 years. The catchment average rainfall intensity for the 120 hour period to Tuesday 11 January 2011 at 19:00 also had an annual recurrence interval of between 1 in 100 years and 1 in 200 years. At some individual rainfall stations within the Brisbane River catchment, rainfall estimates beyond the annual exceedance probability (AEP) limit of extrapolation (1 in 2,000 years) were recorded for durations of between 6 hours and 48 hours.
- On Tuesday morning 11 January 2011, water levels in Wivenhoe Dam began rising rapidly in response to very heavy localised rainfall in the area immediately upstream of the Dam. At the time, the BoM radar indicated this rain was located in an area which does not have any real time rain gauges. Post flood analysis suggests the rainfall required to reproduce this rise could exceed an annual recurrence interval of 1 in 2,000 years and may be well into the extreme category. Rainfall of this intensity and duration over the Wivenhoe Dam lake area at such a critical stage of the Flood Event, was unprecedented.
- The volume of total inflow into Wivenhoe Dam during the Event was 2,650,000ML. This volume has been calculated to be almost double (190%) the comparable volume of inflow from the January 1974 flood event, and comparable with the flood of 1893.
- The inflow into Wivenhoe Dam during the Event is represented by two individual floods, with the peak of each flood separated by about 30 hours. The maximum flow rate at the first peak is estimated to be around 200% of the comparable flow rate calculated from the January 1974 event, while the maximum flow rate at the second peak is estimated to be approximately 230% of the comparable flow rate from the January 1974 event (Source of January 1974 flow: Brisbane River and Pine River Flood Study, October 1994, Report No. 23a).
- The peak water level recorded at many gauges in the Brisbane River, including the Brisbane City gauge, exceeded the BoM-defined major flood level.

EXECUTIVE SUMMARY

Operations during the January 2011 Flood Event

1. During the January 2011 Flood Event, operational decisions were made in accordance with the Manual. Dam outflows contributing to downstream flooding were delayed until it was apparent no other option was available, without risking the safety of Wivenhoe Dam.
2. Two separate floods entered Wivenhoe Dam during the Event. The first flood into Wivenhoe Dam was similar in nature and magnitude to the comparable flood flows of the January 1974 event. The combined mitigation effect of Somerset and Wivenhoe Dams ensured this first flood did not result in urban damage below Moggill however, achieving this result did cause significant filling of the Dams' flood storage compartments.
3. The second flood was also similar in nature and magnitude to the comparable flood flows of the January 1974 event. Rainfall which occurred directly on and near the Wivenhoe Dam lake area contributed to the second flood. Post flood analysis suggests the intensity of this rainfall could have exceeded an annual recurrence interval of 1 in 2,000 years and may be well into the extreme category. The location of this rainfall on and near the Dam also reduced available mitigation options.
4. Due to the level to which the flood compartments were filled by the first flood, the second flood could not be completely contained without risking the safety of the Dams and therefore the inflow of water to the Brisbane River resulted in urban damage below Moggill. The extent of this damage however was greatly reduced by the the operation of the Dams.

Deleted: January 2011 Flood

Deleted: Contributing to the second flood was r

Rainfall forecasts in the early stages of the Event did not support flood releases being made from Wivenhoe Dam, greater than those that actually occurred. An increase to flood releases in the later stages of the Event (prior to the morning of Tuesday 11 January 2011) had the potential to increase urban damage, due to the possible southward movement of the prevailing weather system. Had the rainfall on Tuesday 11 January 2011 fallen south of the Dam, the transition to an operating strategy to protect the safety of the Dam may have been avoided however, urban damage would have likely increased under this scenario, due to the loss of the mitigation effects provided by the Dam.

Given the current level of forecasting technology available, there was an extremely high degree of difficulty in predicting the actual quantity, intensity and spatial distribution of the Event rainfall. This resulted in a high level of uncertainty in predicting the likely Dam inflows in advance of rainfall on the ground and is demonstrated by the three-day and five-day forecast rainfall model results.

The available recorded data shows the January 2011 Flood Event was unprecedented in the history of Somerset and Wivenhoe Dams and rivals the largest floods in the recorded flood history of the region. However, the successful operation of the Dams as flood mitigation storages is considered to have had a major effect on reducing the flood damages in the areas downstream of the Dams.

Deleted: available

Deleted: is

Deleted: ¶

Flood mitigation benefits of Somerset Dam and Wivenhoe Dam

Wivenhoe Dam provided clear and greatly significant flood mitigation benefits during the January 2011 Flood Event as demonstrated below:

- Figure 9.1.2 demonstrates the significant mitigation benefits of Wivenhoe Dam during this Flood Event. The peak of the outflow from the Dam was approximately 40% lower than the peak of the inflow meaning that, just below the Dam, the maximum hourly flow rate in the Brisbane River was reduced by around 40%.
- Without the mitigating effects of Wivenhoe Dam, the peak flood height measured at the Port Office gauge near the Brisbane CBD would have been approximately 2.0m higher than was experienced.
- Based on the current damage curves, these projected reductions in the flood peak height equate to significant reductions in the potential for the loss of life as well as monetary savings in regard to property damages in the order of up to \$5 billion. (Source: Flood Damage Tables - River PMF tab; provided to Seqwater by the Brisbane City Council).
- Without the above flow rate reductions provided by Wivenhoe Dam, it is estimated up to 14,000 more properties would have been impacted by the January 2011 Flood Event. (Source: Flood Damage Tables - River PMF tab; provided to Seqwater by the Brisbane City Council).

EXECUTIVE SUMMARY

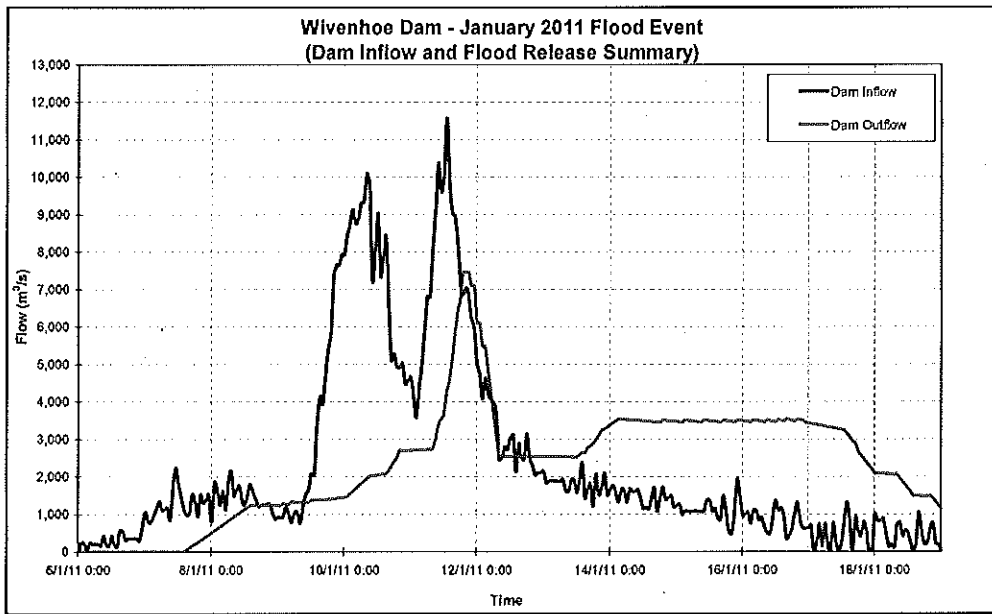

Figure 9.1.2 – Wivenhoe Dam inflow and release summary for the January 2011 Flood Event

Conclusions

The significant conclusions drawn from the information contained in this Report include:

- During the January 2011 Flood Event, Somerset Dam and Wivenhoe Dam were operated in accordance with *The Manual of Operational Procedures for Flood Mitigation at Wivenhoe Dam and Somerset Dam (Revision 7)*.
- The data collection and flood modelling systems used to support decisions made during the Event performed well and assisted informed decision-making, in accordance with the Manual.
- BoM rainfall forecasts did not support the additional release of flood water early in the Event.
- During the Event, Seqwater followed the Department of Environment and Resource Management's draft Communications Protocol which was compiled after the October 2010 flood event. This Protocol was developed to ensure effective communication between local, State and Commonwealth agencies impacted by the release of floodwater from the Dams.
- The January 2011 Flood Event was an extremely large and rare flood event. The combined effects of Somerset Dam and Wivenhoe Dam did reduce flood damages downstream however, they could not fully mitigate the impacts of the Event without putting the safety of the Dams at risk.
- Studies associated with the design and operation of Wivenhoe Dam, dating back to 1971, indicate a flood of the magnitude of the January 2011 Flood Event would be expected to result in urban damage below Moggill.
- The combined effects of Somerset Dam and Wivenhoe Dam provided clear and greatly significant flood mitigation benefits during the January 2011 Flood Event.

Executive summary

Figure 9.1.2 Wivenhoe Dam inflow and release summary for the January 2011 Flood Event

Introduction

- 1.4.1 Wivenhoe Dam infrastructure – arrangement of radial gates
- 1.4.2 Submergence flows for bridges

- 1.5.1 Somerset Dam infrastructure – arrangement of radial gates, sluice gates and regulator valves
- 1.5.2 Wivenhoe / Somerset Operating Target Line

Flood event summary

- 2.1.1 Actual and forecast rainfall comparison (BoM access model)

Event mobilisation and staffing

- 3.3.1 Flood Operations Centre staffing – Flood Operations Engineers
- 3.3.2 Flood Operations Centre staffing – Flood Officers
- 3.3.3 Flood Operations Centre staffing – Wivenhoe Dam Operators

Flood Event procedures

- 4.1.1 Relationship between the Flood Procedure Manual and the Manual of Operational Procedures for Flood Mitigation at Wivenhoe Dam and Somerset Dam
- 4.1.2 Location of controlled hardcopies of Flood Procedure Manual

Data collection system performance

- 5.2.1 Seqwater ALERT rainfall station network as at January 2011
- 5.2.2 Seqwater ALERT water level network as at January 2011
- 5.2.3 Rainfall stations marked out of action or suspect, Thursday 6 January 2011
- 5.2.4 River stations marked out of action or suspect, Thursday 6 January 2011
- 5.2.5 Rain gauges marked out of action or suspect, Wednesday 19 January 2011
- 5.2.6 River gauges marked out of action or suspect, Wednesday 19 January 2011
- 5.2.7 Number of readings received from each rainfall and water level sensor in the ALERT network

Event data

TABLE OF CONTENTS

1 INTRODUCTION

1.1 Preface

Given the potential significant impact on downstream populations and property, it is imperative Somerset and Wivenhoe Dams are operated during flood events in accordance with clearly defined and pre-determined procedures. The current procedures are contained in Revision 7 of *The Manual of Operational Procedures for Flood Mitigation at Wivenhoe Dam and Somerset Dam* ("the Manual") that was gazetted in January 2010. The Manual is an approved flood mitigation manual under the *Queensland Water Supply (Safety and Reliability) Act 2008*. An understanding of the Manual is important when reading this Report.

The Manual requires the owner of Somerset and Wivenhoe Dams (currently Seqwater) to prepare a report after each flood event impacting the Dams. A flood event is defined as a situation where either Somerset and or Wivenhoe Dams exceed their Full Supply Level (FSL) and flood water releases are made. The report must contain details of the procedures used during the flood event, the reasons why procedures were used and other pertinent information. Seqwater must forward the report to the Director General of the Department of Environment and Resource Management (DERM) within six weeks of the completion of the flood event.

This document and its associated volumes comprise the required report relating to the January 2011 Flood Event impacting Somerset and Wivenhoe Dams that commenced on Thursday 6 January 2011 and concluded on Wednesday 19 January 2011. It is due for submission by Wednesday 2 March 2011.

1.2 Meaning of terms

In this report, the following terms are defined as below:

"Act" means the Water Supply (Safety and Reliability) Act 2008;

"AEP" means annual exceedance probability, the probability of a specified event being reached or exceeded in any one year. This may be expressed as a ration (e.g. 1 in Y) or a percentage;

"Agency" includes a person, a local government and a department of state government within the meaning of the *Acts Interpretation Act 1954*;

"AHD" means Australian Height Datum;

"ALERT" means Automated Local Evaluation in Real Time System and a system of monitoring and displaying rainfall and water level data. It is a combination of field stations, communications networks and data collection software;

"AMTD" means the Adopted Middle Thread Distance which is the distance along the centre line of the mainstream from a junction, usually in kilometres;

"AR&R" means *Australian Rainfall and Run-off (Book 6)*, The Institution of Engineers Australia (Engineers Australia), national guidelines for the estimation of design flood characteristics;

"BOM" means the Bureau of Meteorology;

"Chairperson" means the Chairperson of Seqwater;

"Chief Executive" means the Director General of the Department of Environment and Resource Management or nominated delegate;

"Controlled Document" means a document subject to managerial control over its contents, distribution and storage. It may have legal and contractual implications;

"Dams" means Somerset Dam and Wivenhoe Dam;

English (Australia)

1 INTRODUCTION

"**Dam Crest Flood**" the flood event which, when routed through the storage with the storage initially at Full Supply Level, results in the still water level in the storage reaching the lowest point in the dam embankment, excluding wind and wave effects

"**Dam Supervisor**" means the senior on-site officer at Somerset or Wivenhoe Dam as the case may be;

"**DERM**" means the Queensland Government department, the Department of Environment and Resource Management;

"**Duty Flood Operations Engineer**" means the Senior Flood Operations Engineer or Flood Operations Engineer rostered on duty to be in charge of Flood Operations at the Dams;

"**EL**" means elevation in metres Australian Height Datum;

"**Envlromon**" is the Bureau of Meteorology data collection software used to collect and display rainfall and water level data;

"**ERRTS**" means Event Reporting Radio Telemetry System;

Deleted: tations

"**Flood Event**" is a situation where the Duty Flood Operations Engineer expects the water level in either of the Dams to exceed the Full Supply Level;

"**Flood-Col**" is the data collection software used in the Flood Operations Centre to collect and display rainfall and water level data;

"**Flood-Ops**" is the modelling software used in the Flood Operations Centre to model the runoff from the catchments;

"**Flood Operations Centre**" means the centre used by Flood Operations Engineers during a Flood Event to manage the Event;

"**Flood Operations Engineer**" means a person designated to direct flood operations at the Dams in accordance with Section 2.4 of the Manual;

"**Flood Operations Engineers**" means the collective group of persons who individually have designation as either a Flood Operations Engineer or a Senior Flood Operations Engineer;

"**Flood Operations Manager**" means the Flood Operations Engineer responsible for the overall management of the Flood Operations Centre leading up to or during a Flood Event;

Comment [MSOffice1]: John, please check this definition is correct.

Deleted: ¶

"**FSL**" or "**Full Supply Level**" means the level of the water surface when the reservoir is at maximum operating level, excluding periods of flood discharge;

"**Gauge**", when referred to in (m) means river level referenced to AHD or a local datum, and when referred to in (m³/s) means flow rate in cubic metres per second;

Deleted: -

"**IFD**" means Intensity, Frequency, Duration and refers to the statistical analysis of rainfall intensities.

Deleted: -

"**Manual**" or "**Manual of Operational Procedures for Flood Events at Wivenhoe Dam and Somerset Dam**" means the current version (Revision 7) of the Manual;

"**m³/s**" means a rate of water flow being one cubic metre of water per second or 1,000 litres of water per second;

"**OOA**" means 'out of action' in relation to the operation of a rainfall or river height gauge that provides catchment data;

1 INTRODUCTION

"Operating Target Line" means the Wivenhoe/Somerset Operating Target Line from Strategy S2 of the Manual.

"Power Station" means the Wivenhoe pumped storage hydro-electric power station associated with Wivenhoe Dam and Splityard Creek Dam;

"QPF" means Quantitative Precipitation Forecast provided by the Bureau of Meteorology and is an estimate of the predicted rainfall in millimetres, usually in the next 24 hours;

"RTFM" means Real Time Flood Model and is a combination of Flood_Col, Flood_Ops and other ancillary software;

"SD" means State Datum, which is a level height datum that is different from AHD.

"Senior Flood Operations Engineer" means a person designated in accordance with Section 2.9 of the Manual under whose general direction the procedures in the Manual must be carried out;

"Seqwater" means the Queensland Bulk Water Supply Authority trading as Seqwater;

"URBS" means Unified River Basin Simulator.

Note: Dam levels in this document represented as metres (m) are metres Australian Height Datum (m AHD).

1.3 Background

The primary objectives of the procedures contained in the Manual in order of importance are:

1. Ensure the structural safety of the Dams;
2. Provide optimum protection of urbanised areas from inundation;
3. Minimise disruption to rural life in the valleys of the Brisbane and Stanley Rivers;
4. Retain the storage at Full Supply Level (FSL) at the conclusion of the flood event;
5. Minimise impacts to riparian flora and fauna during the drain down phase of the flood event.

In meeting these objectives, the Dams must be operated to account for the potential effects of closely spaced flood events. Normal operating procedures require stored floodwaters to be emptied from the Dams within seven days of the flood event peak passing through the Dams. During flood events, Somerset Dam and Wivenhoe Dam are operated in conjunction to maximise the overall flood mitigation capabilities of the two Dams.

1.4 Wivenhoe Dam

Wivenhoe Dam is a dual purpose storage facility that provides urban water supplies (including drinking water) to South East Queensland as well as flood mitigation benefits to areas impacted by flood flows along the Brisbane River below the Dam. Depending on the origin, magnitude and spatial extent of the flood, Wivenhoe Dam can be operated in a number of ways to reduce flooding downstream of the Dam. Maximum overall flood mitigation can be achieved by operating Wivenhoe Dam in conjunction with Somerset Dam.

The capacity of the urban water supply compartment that relates to Wivenhoe Dam's FSL is 1,165,000ML. The reservoir volume above the FSL that is used as temporary flood storage is 1,450,000ML. How much of this flood storage compartment is utilised during a flood event depends on the initial reservoir level below the FSL, the magnitude of the flood being regulated and the procedures adopted.

Radial gates and an auxiliary spillway are the primary infrastructure used to release water during flood events at Wivenhoe Dam. The arrangement of the radial gates is shown in Figure 1.4.1.

1 INTRODUCTION

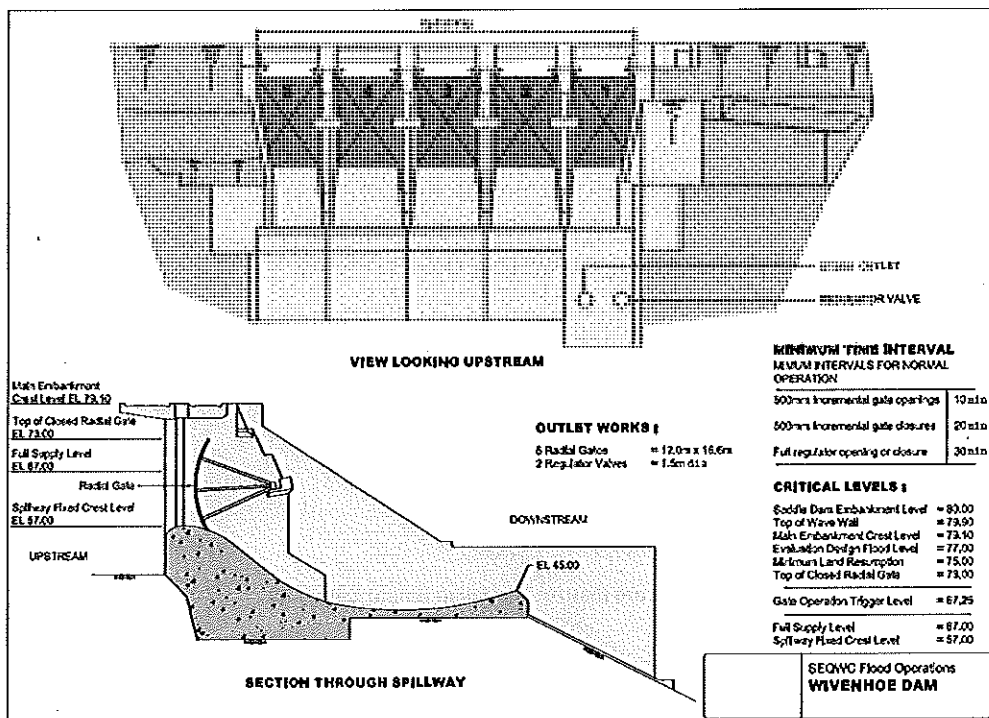

Figure 1.4.1 – Wivenhoe Dam Infrastructure – arrangement of radial gates

An auxiliary spillway was constructed in 2005 as part of an upgrade to improve Wivenhoe Dam's flood immunity. The auxiliary spillway consists of a three bay fuse plug spillway at the right abutment. In association with other constructions at the Dam, the spillway gives the Dam Crest Flood an AEP of approximately 1 in 100,000 years.

Deleted: the

Deleted: is

Once a flood event is declared, the magnitude of the event is assessed by predicting:

- The maximum storage levels in Somerset and Wivenhoe Dams;
- The peak flow rate at the Lowood gauge, excluding Wivenhoe Dam releases;
- The peak flow rate at the Moggill gauge, excluding Wivenhoe Dam releases.

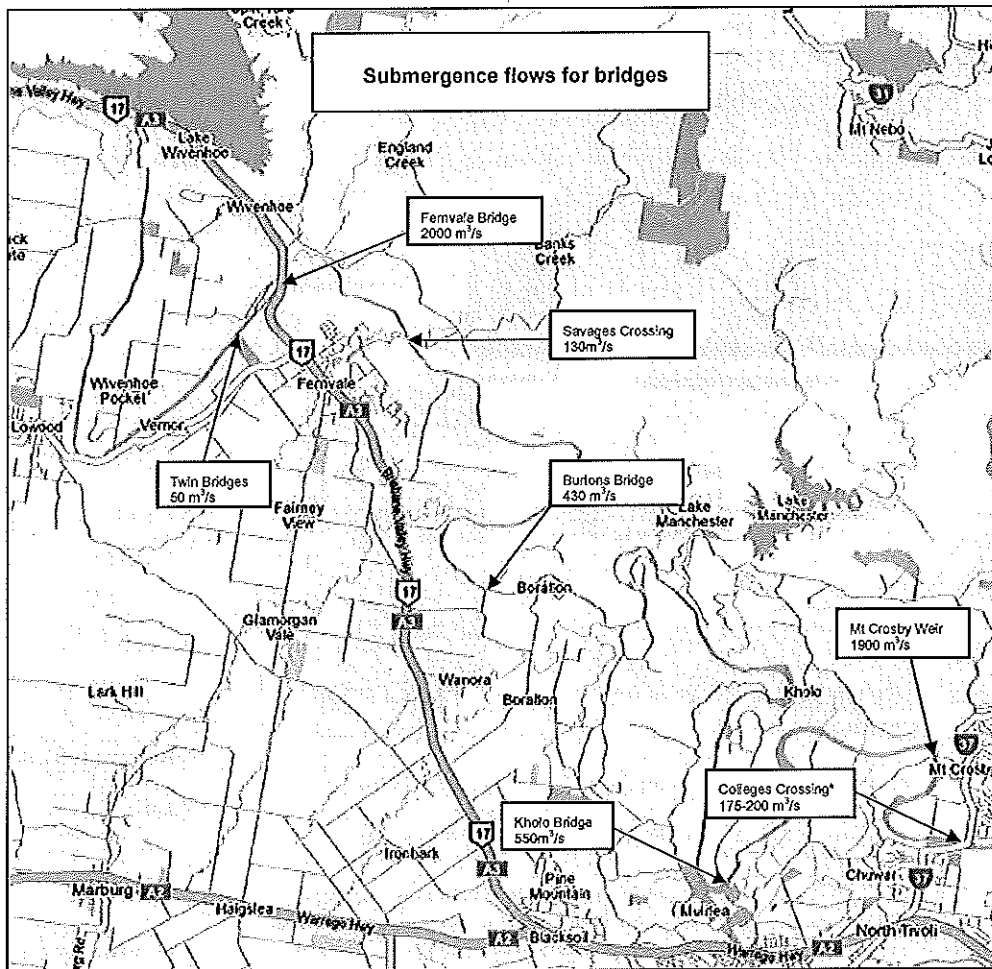

According to the Manual, the spillway gates are not to be opened for flood control purposes prior to the reservoir level exceeding 67.25m.

Deleted: T

The strategies contained in the Manual require significant control over Dam releases to be exercised, as well as knowledge of flows into the Brisbane River from both Lockyer Creek and the Bremer River, below Wivenhoe Dam.

In small floods, releases are controlled to ensure the combined flow from Lockyer Creek and Wivenhoe Dam is less than the limiting values contained in the strategies, to delay the submergence of bridges and to minimise disruption to rural life in the Brisbane and Stanley River valleys. Figure 1.4.2 shows the location of bridges impacted by Dam releases and the approximate river flow rate at which they are closed to traffic.

* Note: Colleges Crossing is also affected by tides

Figure 1.4.4 – Submergence flows for bridges

During larger floods, releases from Wivenhoe Dam are controlled to protect urbanised areas from inundation. The releases are controlled so the combined flow from Wivenhoe Dam, Lockyer Creek and the Bremer River is either minimised or kept below the threshold level for urban damage which is 4,000m³/s at Moggill.

Deleted: the

In large flood events, releases from Wivenhoe Dam are also controlled to ensure the structural safety of the Dam is not put at risk of failure.

Deleted: ¶

1.5 Somerset Dam

Somerset Dam is able to be operated in a number of ways to regulate the flood level of Stanley River. Somerset and Wivenhoe Dams are to be operated in conjunction to optimise the flood mitigation benefits downstream of Wivenhoe Dam. Radial gates, sluice gates and regulator valves are the primary infrastructure used to release water during flood events at Somerset Dam. The arrangement of this infrastructure is shown in Figure 1.5.1.

Formatted: Not Highlight

1 INTRODUCTION

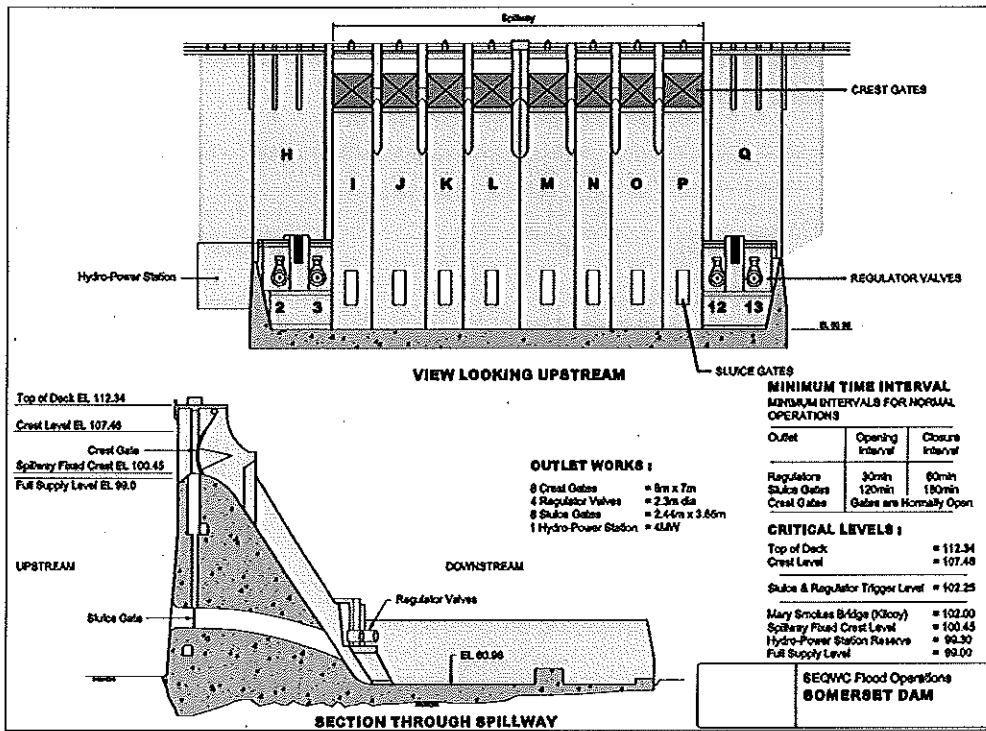

Figure 1.5.1 - Somerset Dam infrastructure - arrangement of radial gates, sluice gates and regulator valves.

Deleted: ¶

1.6 Operating Somerset Dam in conjunction with Wivenhoe Dam

The strategies used to operate Somerset Dam during a flood event are intended to maximise the benefits of the flood storage capabilities of the Dam while protecting the structural safety of both Somerset and Wivenhoe Dams. To achieve this, a Wivenhoe/Somerset Operating Target Line (Figure 1.6.1) is used to set a goal for balancing the use of the flood storage in each Dam.

Formatted: Not Highlight

The Wivenhoe/Somerset Operating Target Line was selected based on the following factors:

- Equal minimisation of flood level peaks in both Dams in relation to their associated failure levels;
- Minimisation of flows in the Brisbane River downstream of Wivenhoe Dam;
- Consideration of the time needed at the onset of a flood event to properly assess the magnitude of the flood event and the likely impacts. This is to ensure the likely optimal strategy to maximise the flood mitigation benefits of the storages can be selected.

The target point on the Operating Target Line at any point in time is based on the maximum storage levels in Somerset and Wivenhoe Dams, using the best forecast rainfall and stream flow information available at the time. Gate operations enable the progressive movement of the duty point towards the target line. It is not necessarily possible to adjust the duty point directly towards the target line in a single gate operation.

2 FLOOD EVENT SUMMARY

2.1 Summary of the January 2011 Flood Event

The following summary must be read in conjunction with *The Manual of Operational Procedures for Flood Mitigation at Wivenhoe Dam and Somerset Dam (Revision 7)* ("the Manual"). It provides a detailed summary of the operation of Somerset and Wivenhoe Dams during the January 2011 Flood Event. Each table below covers a period of the Event during which one of the following occurred:

- There was a transition or change to the flood operation strategy used, as defined by the Manual;
- There was a period of stability during which no gate operations from either Somerset Dam or Wivenhoe Dam were directed;
- There was a period of sustained gate operations (either opening or closing) at either Somerset Dam or Wivenhoe Dam.

Each table also provides a summary of relevant background information and a summary of the information that was used to make decisions during the period covered by the table. This information includes:

- Details of the time period;
- Relevant background information from the period leading up to and during the period;
- Changes in Dam conditions during the period;
- Rainfall information (including forecast rainfall) and model results available during the period;
- The strategy used and/or adopted during the period.

The source data for the information shown in the tables below can be found in the following Appendices of this Report:

- Appendix A – Model results
- Appendix B – Flood volume summary
- Appendix C – Quantitative Precipitation Forecasts (QPF)
- Appendix D – Catchment rainfall
- Appendix E – Situation reports
- Appendix G – Severe weather warnings
- Appendix H – Flood Event notification email
- Appendix L – Flood operations directives
- Appendix M – Flood Event log

Note: Dam levels in this document represented as metres (m) are in metres Australian Height Datum (m AHD).

2 FLOOD EVENT SUMMARY

January 2011 Flood Event – Period 1 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Thursday 06 Jan 2011 07:42</p> <p>Completed Friday 07 Jan 2011 02:00</p>	<p>Strategy W1A and Strategy W1B; and Strategy S2</p> <ul style="list-style-type: none"> Catchment conditions prior to the Event are as described in Section 6.0. The Event was considered a continuation of the ongoing wet period that commenced in October 2010. No significant rainfall occurred in the 24 hours to 09:00 on 5 Jan 2011. Catchment average rainfalls in the 24 hours to 08:00 on 6 Jan 2011 were: <ul style="list-style-type: none"> Wivenhoe Dam 25mm; Somerset Dam 21mm; Lockyer Creek 23mm; Bremer River 23mm. Event mobilisation occurred at 07:42 on 6 Jan 2011, using Strategies W1A and S2. Once mobilisation occurred, 24/7 staffing of the Flood Operations Centre and Dams continued until official de-mobilisation was announced. This occurred at 12:00 on 19 Jan 2011. Duty Engineer was called back early from holidays to assist with the management of the Event. Transitioned from Strategy W1A to W1B once the Wivenhoe lake level exceeded 67.50m. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 53mm; Somerset Dam 44mm; Lockyer Creek 53mm; Bremer River 54mm. <p>Wivenhoe Dam level rose from 67.31m to 67.52m over the 18-hour period.</p> <p>Somerset Dam level rose from 99.34m to 99.55m over the 18-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 28mm; Somerset Dam 23mm; Lockyer Creek 30mm; Bremer River 31mm. Forecast 24-hour catchment average rainfall at 16:00 on 6 Jan 2011 was 25mm. Estimated peak Wivenhoe Dam level: 68.2m (excluding forecast); 68.7m (including forecast). Estimated peak Somerset Dam level: 99.7m (excluding forecast); 100.1m (including forecast). Estimated total Dam inflow: 204,000ML (excluding forecast); 343,000ML (including forecast). Estimated peak flow at Lowood excluding Wivenhoe Dam releases: 470m³/s (excluding forecast); 720m³/s (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: 550m³/s (excluding forecast); 960m³/s (including forecast). These peaks were not expected to occur for more than 24 hours beyond period end. Colleges Crossing remained open in the short term. Estimated peak Wivenhoe Dam outflow: 1,220m³/s (excluding forecast); 1,260m³/s (including forecast). 	<p>Strategy W1A and Strategy W1B Strategy S2 (Lake level greater than 67.25m, maximum release 110m³/s)</p> <ul style="list-style-type: none"> Peak inflows into the Brisbane River from Lockyer Creek were estimated to be in the order of 400m³/s. These flows would not inundate Colleges Crossing until the morning of 7 Jan 2011. Lake level was not expected to reach 67.50m (Strategy W1B) until 7 Jan 2011. Lake level may not exceed 68.5m. Endeavoured to keep Colleges Crossing trafficable by limiting combined flows from Wivenhoe Dam and Lockyer Creek to a maximum of 175m³/s. Water was held in Wivenhoe Dam in an attempt to keep Colleges Crossing trafficable in accordance with Strategy W1A. Low level releases continued from the Mini-Hydro at this time and at various stages during the Event. However, these releases (in the order of 13m³/s) have low relative significance and are not referred to specifically in the remainder of this summary document. In accordance with Strategy S2, the crest gates at Somerset Dam were raised to enable uncontrolled discharge. The low level sluices were kept closed. Some regulator releases continued from December as part of previous event drain down, (in the order of 35m³/s) and these were shut down at 18:00 on 7 Jan 2011.

2 FLOOD EVENT SUMMARY

January 2011 Flood Event – Period 2 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Friday 07 Jan 2011 02:00</p> <p>Completed Friday 07 Jan 2011 09:00</p>	<p>Strategy W1B and Strategy S2</p> <ul style="list-style-type: none"> Transitioned from Strategy W1A to W1B due to the Wivenhoe lake level exceeding 67.50m. Transitioned from Strategy W1B to W1C once the Wivenhoe lake level exceeded 67.75m. Colleges Crossing was inundated by natural river flows during this period. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 64mm; Somerset Dam 60mm; Lockyer Creek 57mm; Bremer River 60mm. <p>Wivenhoe Dam level rose from 67.52m to 67.75m over the seven-hour period.</p> <p>Somerset Dam level rose from 99.55m to 99.65m over the seven-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 11mm; Somerset Dam 15mm; Lockyer Creek 4mm; Bremer River 5mm. Forecast 24 hour catchment average rainfall at 10:00 on 6 Jan 2011 was 25mm. Estimated peak Wivenhoe Dam level: 68.2m (excluding forecast); 68.5m (including forecast). Estimated peak Somerset Dam level: 99.8m (excluding forecast); 100.2m (including forecast). Estimated total Dam inflow: 242,000ML (excluding forecast); 380,000ML (including forecast). Estimated peak flow at Lowood excluding Wivenhoe Dam releases: 470m³/s (excluding forecast); 670m³/s (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: 570m³/s (excluding forecast); 970m³/s (including forecast). Estimated peak Wivenhoe Dam outflow: 1,220m³/s (excluding forecast); 1,250m³/s (including forecast). 	<p>Strategy W1B and Strategy S2 (Lake level greater than 67.50m, maximum release 380m³/s)</p> <ul style="list-style-type: none"> Endeavoured to keep Burtons Bridge trafficable by limiting combined flows from Wivenhoe Dam and Lockyer Creek to a maximum of 430m³/s. Peak inflows into the Brisbane River from Lockyer Creek were estimated to be in the order of 470m³/s. These flows may not be sufficient to inundate Burtons Bridge. Lake level was not expected to reach 67.75m (Strategy W1C) for at least six hours. Lake level may not exceed 68.5m. Water was held in Wivenhoe Dam in an attempt to keep Burtons Bridge trafficable in accordance with Strategy W1B. In accordance with Strategy S2, the crest gates at Somerset Dam were raised to enable uncontrolled discharge and the low level regulators and sluices at Somerset Dam were kept closed.

2 FLOOD EVENT SUMMARY

January 2011 Flood Event – Period 3 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Friday 07 Jan 2011 09:00</p> <p>Completed Friday 07 Jan 2011 15:00</p>	<p>Strategy W1C and Strategy S2</p> <ul style="list-style-type: none"> At around 09:00 it became apparent flows from Lockyer Creek into the Brisbane River, combined with local Brisbane River inflows downstream of Wivenhoe Dam, would be sufficient to inundate all bridges below the Dam, with the exception of Mt Crosby Weir Bridge and Fernvale Bridge. Burtons Bridge was inundated by natural river flows near the end of this period. All impacted Councils were notified of the situation and that releases would commence from Wivenhoe Dam. Releases were timed to occur at 15:00 to allow bridges to be closed and arrangements to be made to cater for rural community isolation. The impacted rural communities had been isolated over the Christmas period and time was needed for suitable arrangements to be made to allow these communities to prepare for another potentially extended period of isolation. Releases were timed to start in accordance with the Manual requirements of keeping Burtons Bridge and Kholo Bridge open to traffic when operating under Strategy W1C. Transitioned from Strategy W1C to Strategy W1D once the Wivenhoe Dam lake level exceeded 68.0m. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 89mm; Somerset Dam 90mm; Lockyer Creek 71mm; Bremer River 71mm. <p>Wivenhoe Dam level rose from 67.75m to 68.03m over the six-hour period.</p> <p>Somerset Dam level rose from 99.65m to 99.94m over the six-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 24mm; Somerset Dam 30mm; Lockyer Creek 14mm; Bremer River 12mm. Forecast 24-hour catchment average rainfall at 10:00 on 7 Jan 2011 was 25mm. Estimated peak Wivenhoe Dam level: 68.4m (excluding forecast); 68.9m (including forecast). Estimated peak Somerset Dam level: 100.3m (excluding forecast); 100.6m (including forecast). Estimated total Dam inflow: 346,000ML (excluding forecast); 483,000ML (including forecast). Estimated peak flow at Lowood excluding Wivenhoe Dam releases: 530m³/s (excluding forecast); 710m³/s (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: 660m³/s (excluding forecast); 1,040m³/s (including forecast). Estimated peak Wivenhoe Dam outflow: 1,240m³/s (excluding forecast); 1,270m³/s (including forecast). 	<p>Strategy W1C (Lake level greater than 67.75m, maximum release 500m³/s)</p> <ul style="list-style-type: none"> Due to the further rain and observed stream rises, it became apparent flows from Lockyer Creek into the Brisbane River, combined with local Brisbane River inflows downstream of Wivenhoe Dam, would be sufficient to inundate all bridges downstream of the Dam, with the exception of the Mt Crosby Weir Bridge and Fernvale Bridge. Releases from Wivenhoe Dam were managed in an attempt to ensure Mt Crosby Weir Bridge and Fernvale Bridge remained trafficable in accordance with Strategies W1D and W1E. In accordance with Strategy S2, the crest gates at Somerset Dam were raised to enable uncontrolled discharge, and the low level regulators and sluices at Somerset Dam were kept closed.

2 FLOOD EVENT SUMMARY

January 2011 Flood Event – Period 4 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Friday 07 Jan 2011 15:00</p> <p>Completed Saturday 08 Jan 2011 14:00</p>	<p>Transition from Strategy W1D to W1E to W3; and Strategy S2 Wivenhoe Directives #1 to #4. Somerset Directives #1 to #3.</p> <ul style="list-style-type: none"> Gates opened continuously at Wivenhoe Dam for 23 hours, in accordance with standard gate opening sequence at a rate of 0.5m of opening per hour. Transitioned from Strategy W1D to W1E when the Wivenhoe Dam level exceeded 68.25m (22:00 on 7 Jan 2011). Transitioned from Strategy W1E to W3 as it became apparent Wivenhoe Dam level would exceed 68.50m (08:00 on 8 Jan 2011). Strategy W2 was by-passed as it was not possible to achieve this strategy by limiting the flow in the Brisbane River to less than the naturally occurring peaks at Lowood and Moggill. This is because the calculated naturally occurring peaks at Lowood and Moggill were 530m³/s and 770m³/s respectively, whereas the release rate from the Dam was already 940m³/s. Limiting releases to these naturally occurring peak flows would also have compromised the Dam drain-down requirements. At 14:00 on 8 Jan 2011, Wivenhoe Dam discharge was 1,239m³/s. All rural bridges below the Dam, with the exception of Mt Crosby Weir Bridge and Fernvale Bridge, were flooded. 	<p>Total rainfall from 0800 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 92mm; Somerset Dam 95mm; Lockyer Creek 72mm; Bremer River 72mm. <p>Wivenhoe Dam level rose from 68.03m to 68.61m over the 23-hour period.</p> <p>Somerset Dam level rose from 99.94m to 100.44m over the 23-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 3mm; Somerset Dam 5mm; Lockyer Creek 1mm; Bremer River 1mm. Forecast 24-hour catchment average rainfall at 10:00 on 8 Jan 2011 was 40mm. Estimated peak Wivenhoe Dam level: 68.7m (excluding forecast); 69.1m (including forecast). Estimated peak Somerset Dam level: 100.5m (excluding forecast); 100.6m (including forecast). Estimated total Dam inflow: 420,000ML (excluding forecast); 662,000ML (including forecast). Estimated peak flow at Lowood excluding Wivenhoe Dam releases: 530m³/s (excluding forecast); 530m³/s (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: 770m³/s (excluding forecast); 940m³/s (including forecast). Estimated peak Wivenhoe Dam outflow: 1,480m³/s (excluding forecast); 1,540m³/s (including forecast). This flow was significantly greater than the calculated natural peak that excluded Wivenhoe Dam releases. 	<p>Strategy W3 and Strategy S2 (Lake level greater than 68.50m, maximum release 4,000m³/s)</p> <ul style="list-style-type: none"> Inflows from Lockyer Creek into the Brisbane River had inundated all bridges downstream of the Dam, with the exception of the Mt Crosby Weir Bridge and Fernvale Bridge. The strategy transitioned from W1 to W3 as it became apparent Wivenhoe Dam level was likely to exceed 68.5m and Strategy W2 couldn't be applied. Strategy W3 required the flow at Moggill to be lowered to 4,000m³/s as soon as possible after the naturally occurring peak at Moggill (excluding Wivenhoe Dam releases). This was already achieved. Strategy W3 also required lower level Manual objectives to be considered. Therefore consideration was given to minimising disruption to downstream rural life and endeavouring to keep Mt Crosby Weir Bridge and Fernvale Bridge trafficable. There was also awareness Wivenhoe Dam outflows were already more than doubling the natural peak flow at Moggill. Due to rainfall on the ground, it was apparent the Somerset Dam level would exceed 100.45m. Accordingly, two sluice gates were opened during this period to allow Dam levels to move towards the Operating Target Line in accordance with Strategy S2.

2 FLOOD EVENT SUMMARY

January 2011 Flood Event – Period 5 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Saturday 08 Jan 2011 14:00</p> <p>Completed Sunday 09 Jan 2011 01:00</p>	<p>Strategy W3 and Strategy S2</p> <ul style="list-style-type: none"> Releases maintained from both Wivenhoe and Somerset Dams to ensure Mt Crosby Weir Bridge and Fernvale Bridge remained trafficable. No change to gate settings over this period. Wivenhoe Dam discharge was 1,240m³/s. All rural bridges below the Dam, with the exception of the Mt Crosby Weir Bridge and Fernvale Bridge, were flooded. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 100mm; Somerset Dam 111mm; Lockyer Creek 75mm; Bremer River 75mm. <p>Wivenhoe Dam level rose very slightly from 68.61m to 68.63m over the 13-hour period.</p> <p>Somerset Dam level fell from 100.44m to 100.32m over the 13-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 8mm; Somerset Dam 16mm; Lockyer Creek 3mm; Bremer River 2mm. Forecasted 24-hour catchment average rainfall at 16:00 on 8 Jan 2011 was 40mm. Estimated peak Wivenhoe Dam level: 68.7m (excluding forecast); 69.9m (including forecast). Estimated peak Somerset Dam level: 100.5m (excluding forecast); 100.6m (including forecast). Estimated total Dam inflow: 457,000ML (excluding forecast); 697,000ML (including forecast). Estimated peak flow at Lowood excluding Wivenhoe Dam releases: 530m³/s (excluding forecast); 530m³/s (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: 770m³/s (excluding forecast); 840m³/s (including forecast). This peak is estimated to have occurred at 05:00 on 8 Jan 2011. Estimated peak Wivenhoe Dam outflow: 1,480m³/s (excluding forecast); 1,520m³/s (including forecast). This flow was significantly greater than the calculated natural peak that excluded Wivenhoe Dam releases. 	<p>Strategy W3 and Strategy S2 (Lake level greater than 68.50m, maximum release 4,000m³/s)</p> <ul style="list-style-type: none"> Strategy W3 required the flow at Moggill to be lowered to 4,000m³/s as soon as possible after the naturally occurring peak at Moggill (excluding Wivenhoe Dam releases). This was already achieved. Strategy W3 also required lower level Manual objectives to be considered. Therefore, with lake levels rising slightly (Wivenhoe Dam) and falling (Somerset Dam) consideration during this period remained on minimising disruption to downstream rural life and endeavouring to keep Mt Crosby Weir Bridge and Fernvale Bridge trafficable. There was also awareness Wivenhoe Dam outflows were already more than doubling the natural peak flow at Moggill. Increasing the Wivenhoe Dam release to produce a flow at Moggill of up to 3,000m³/s during this period would have moved the operating strategy back to W1 in around 18 hours. This approach was not justifiable at the time given the impacts of such a flow down the river system that included localised flooding in Brisbane. With the Somerset Dam level still expected to exceed 100.45m, and the level in Wivenhoe Dam remaining relatively static, releases from Somerset Dam continued. Closing of the sluices would have resulted in Dam levels quickly moving under the Operating Target Line requiring sluice re-opening within a short period.

2 FLOOD EVENT SUMMARY

January 2011 Flood Event – Period 6 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Sunday 09 Jan 2011 01:00</p> <p>Completed Sunday 09 Jan 2011 08:00</p>	<p>Strategy W3 and Strategy S2 Wivenhoe Directives #5 to #7.</p> <ul style="list-style-type: none"> Releases increased marginally from Wivenhoe Dam to account for the passing of the Lockyer Creek peak while ensuring Mt Crosby Weir Bridge and Fernvale Bridge remained trafficable. Wivenhoe Dam discharge increased from 1,240m³/s to 1,334m³/s. There were no changes to Somerset Dam gate settings over this period. All rural bridges below the Dam, with the exception of the Mt Crosby Weir Bridge and Fernvale Bridge, were flooded. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 112mm; Somerset Dam 146mm; Lockyer Creel 76mm; Bremer River 75mm. <p>Wivenhoe Dam level fell from 68.63m to 68.56m over the seven-hour period.</p> <p>Somerset Dam level fell from 100.32m to 100.28m over the seven-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 12mm; Somerset Dam 36mm; Lockyer Creek 1mm; Bremer River 0mm. Forecast 24-hour catchment average rainfall at 16:00 on 8 Jan 2011 was 40mm. Estimated peak Wivenhoe Dam level: 68.7m (excluding forecast); 69.3m (including forecast). Estimated peak Somerset Dam level: 100.5m (excluding forecast); 101.0m (including forecast). Estimated total Dam inflow: 569,000ML (excluding forecast); 814,000ML (including forecast). Estimated peak flow at Lowood excluding Wivenhoe Dam releases: 530m³/s (excluding forecast); 530m³/s (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: 770m³/s (excluding forecast); 780m³/s (including forecast). This peak is estimated to have occurred at 05:00 on 8 Jan 2011. Estimated peak Wivenhoe Dam outflow: 1,500m³/s (excluding forecast); 1,550m³/s (including forecast). This flow is significantly greater than the calculated natural peak that excluded Wivenhoe Dam releases. 	<p>Strategy W3 and Strategy S2 (Lake level greater than 68.50m, maximum release 4,000m³/s)</p> <ul style="list-style-type: none"> Strategy W3 required the flow at Moggill to be lowered to 4,000m³/s as soon as possible after the naturally occurring peak at Moggill (excluding Wivenhoe Dam releases). This was already achieved. Strategy W3 also required lower level Manual objectives to be considered. Therefore, with lake levels falling at both dams, consideration during this period remained on minimising disruption to downstream rural life and endeavouring to keep Mt Crosby Weir Bridge and Fernvale Bridge trafficable. There was also awareness Wivenhoe Dam outflows were already more than doubling the natural peak flow at Moggill. Increasing the Wivenhoe Dam release to produce a flow at Moggill of up to 3,000m³/s during this period would have moved the operating strategy back to W1 in around 18 hours. This approach was not justifiable at the time given the impacts of such a flow down the river system that included localised flooding in Brisbane. With the Somerset Dam level still expected to exceed 100.45m, and the level in Wivenhoe Dam falling, releases from Somerset Dam continued. Closing of the sluices would have resulted in dam levels quickly moving under the Operating Target Line requiring sluice re-opening within a short period, particularly given the rainfall that occurred in the Somerset Dam catchment during this period.

2 FLOOD EVENT SUMMARY

January 2011 Flood Event – Period 7 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Sunday 09 Jan 2011 08:00</p> <p>Completed Sunday 09 Jan 2011 14:00</p>	<p>Strategy W3 and Strategy S2 Wivenhoe Directives #7. Somerset Directives #4 to #5.</p> <ul style="list-style-type: none"> Releases increased marginally from Wivenhoe Dam to account for the passing of the Lockyer Creek peak while ensuring Mt Crosby Weir Bridge and Fernvale Bridge remained trafficable. Wivenhoe Dam discharge increased from 1,334m³/s to 1,386m³/s. Somerset Dam sluice gates opened progressively over this period to allow Dam levels to move towards the Operating Target Line in accordance with Strategy S2. All rural bridges below the Dam, with the exception of the Mt Crosby Weir Bridge and Fernvale Bridge, were flooded. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 146mm; Somerset Dam 199mm; Lockyer Creek 94mm; Bremer River 90mm. <p>Wivenhoe Dam level rose very slightly from 68.56m to 68.58m over the six-hour period.</p> <p>Somerset Dam level rose from 100.28m to 100.47m over the six-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 34mm; Somerset Dam 53mm; Lockyer Creek 18mm; Bremer River 15mm. Forecast 24-hour catchment average rainfall at 10:00 on 9 Jan 2011 was 50mm. Estimated peak Wivenhoe Dam level: 70.0m (excluding forecast); 71.3m (including forecast). Estimated peak Somerset Dam level: 100.4m (excluding forecast); 101.1m (including forecast). Estimated total Dam inflow: 804,000ML (excluding forecast); 1,108,000ML (including forecast). Estimated peak flow at Lowood excluding Wivenhoe Dam releases: 530m³/s (excluding forecast); 690m³/s (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: 770m³/s (excluding forecast); 1,210m³/s (including forecast). This peak was estimated to have occurred at 05:00 on 8 Jan 2011. Estimated peak Wivenhoe Dam outflow: 1,490m³/s (excluding forecast); 1,560m³/s (including forecast). This flow was significantly greater than the calculated natural peak that excluded Wivenhoe Dam releases. 	<p>Strategy W3 and Strategy S2 (Lake level greater than 68.50m, maximum release 4,000m³/s)</p> <ul style="list-style-type: none"> With lake levels rising at both Dams and heavy rain being experienced in the Dam catchments, consideration was given to transitioning from minimising disruption to downstream rural life to protecting urban areas from inundation. However, using the BoM rainfall forecasts, a three day assessment (see Appendix K) showed the lower limit of three day forecast inflow to be similar to the October 2010 flood event, with the upper limit similar to the February 1999 flood event. Therefore, during this period, consideration remained on minimising disruption to downstream rural life and endeavouring to keep Mt Crosby Weir Bridge and Fernvale Bridge trafficable. This was the approach used during both the October 2010 the February 1999 flood event. With Dam levels under the Operating Target Line at the end of this period, releases continued from Somerset Dam.

2 FLOOD EVENT SUMMARY

January 2011 Flood Event – Period 8 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Sunday 09 Jan 2011 14:00</p> <p>Completed Sunday 09 Jan 2011 19:00</p>	<p>Strategy W3 and Strategy S2</p> <ul style="list-style-type: none"> During this period, releases continued from both Dams at a level that ensured Mt Crosby Weir Bridge and Fernvale Bridge remained trafficable. Gate settings were unchanged and the Wivenhoe Dam discharge was 1,411m³/s. Due to rainfall on the ground and the modelled rapid lake level rises, a decision was made to focus on protecting urban areas from inundation at 19:00. Councils, the Dam Safety Regulator and Seqwater's CEO were notified of the decision soon after 19:00. The ramifications of the decision were that the new estimated peak flow at Moggill of 3,300m³/s would impact properties and begin to damage urban areas below Moggill. Brisbane City Council damage tables indicated at flows of 3,000m³/s, damage costs would exceed \$5.0 million and 2,600 properties would be impacted in some way. The level of impact would increase significantly as flows increased and therefore the focus was on minimising the flow at Moggill. A decision was made at 19:00, to staff the Flood Operations Centre with at least two Duty Engineers at all times until the peak of the Event had occurred. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 208mm; Somerset Dam 305mm; Lockyer Creek 116mm; Bremer River 96mm. <p>Wivenhoe Dam level rose from 68.58m to 68.97m over the five-hour period.</p> <p>Somerset Dam level rose from 100.47m to 101.43m over the five-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 62mm; Somerset Dam 106mm; Lockyer Creek 22mm; Bremer River 6mm. Forecast 24-hour catchment average rainfall at 16:00 on 9 Jan 2011 was 65mm. Estimated peak Wivenhoe Dam level: 72.1m (excluding forecast); 73.9m (including forecast). Estimated peak Somerset Dam level: 102.3m (excluding forecast); 103.0m (including forecast). Estimated total Dam inflow: 1,272,000ML (excluding forecast); 1,712,000ML (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: 770m³/s (excluding forecast); 1,940m³/s (including forecast). This peak was estimated to have occurred at 05:00 on 8 Jan 2011. Estimated peak flow at Moggill including Wivenhoe Dam releases: 3,300m³/s (excluding forecast); 4,400m³/s (including forecast). 	<p>Strategy W3 and Strategy S2 (Lake level greater than 68.50m, maximum release 4,000m³/s)</p> <ul style="list-style-type: none"> Lake levels were continuing to rise at both Dams, and combined with heavy rain in the Dam catchments during this period, it was decided at the end of the period to no longer consider minimising disruption to downstream rural life and to focus only on protecting urban areas from inundation. Towards the end of this period, it became apparent Moggill was likely to experience a second naturally occurring peak on 10 Jan 2011 or later. The Manual required the flow at Moggill to be minimised prior to this peak occurring. This requirement competed with the need to protect urban areas by not allowing the Wivenhoe Dam to reach a level that invoked Strategy W4. It was decided the best course of action was to increase releases as quickly as possible to the limit of non-damaging flows at Moggill. However, before this could occur, Councils needed to be advised, bridges needed to be closed and actions needed to be taken to prepare rural communities for isolation and urban areas below Moggill for river flows approaching 3,500m³/s. With Dam levels under the Operating Target Line during this period, releases continued from Somerset Dam.

2 FLOOD EVENT SUMMARY

January 2011 Flood Event – Period 9 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Sunday 09 Jan 2011 19:00</p> <p>Completed Monday 10 Jan 2011 01:00</p>	<p>Strategy W3 and Strategy S2</p> <ul style="list-style-type: none"> Agency notifications commenced at 19:00. Brisbane City Council, the Dam Safety Regulator and Seqwater's CEO were advised the likely peak flow at Moggill would exceed 3,000m³/s. Brisbane City Council damage tables indicated, at flows of 3,000m³/s, damage costs would exceed \$5.0 million and 2,600 properties would be impacted in some way. The level of impact would increase significantly as flows increased, and therefore the focus was on minimising the flow at Moggill. Fernvale Bridge was closed by police at around 01:00 on 10 Jan 2011. A directive was issued to increase releases from Wivenhoe Dam. Gate settings did not change over this period due to the potential danger to the public associated with inundating Fernvale Bridge from Wivenhoe Dam outflows prior to the bridge being closed to traffic. Councils also required time to prepare for the isolation of rural communities, the onset of urban damage below Moggill and to undertake any necessary evacuations. Wivenhoe Dam discharge was 1,473m³/s. All rural bridges below the Dam, with the exception of Mt Crosby Weir Bridge and Fernvale Bridge, were flooded. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 232mm; Somerset Dam 343mm; Lockyer Creek 131mm; Bremer River 102mm. <p>Wivenhoe Dam level rose from 68.97m to 69.9m over the six-hour period.</p> <p>Somerset Dam level rose from 101.43m to 102.54m over the six-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 24mm; Somerset Dam 38mm; Lockyer Creek 14mm; Bremer River 6mm. Forecast 24-hour catchment average rainfall at 16:00 on 9 Jan 2011 was 65mm. Estimated peak Wivenhoe Dam level: 72.9m (excluding forecast); 74.7m (including forecast). Estimated peak Somerset Dam level: 102.9m (excluding forecast); 103.4m (including forecast). Estimated total Dam inflow: 1,468,000ML (excluding forecast); 1,922,000ML (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: 820m³/s (excluding forecast); 2,000m³/s (including forecast). This peak was estimated to occur at 16:00 on 10 Jan 2011. Estimated peak flow at Moggill including Wivenhoe Dam releases: 3,240m³/s (excluding forecast); 4,480m³/s (including forecast). 	<p>Strategy W3 and Strategy S2 (Lake level greater than 68.50m, maximum release 4,000m³/s)</p> <ul style="list-style-type: none"> Consideration now focused on protecting urban areas from inundation. However, before releases were increased to and above the limit of non-damaging floods at Moggill, Councils and other impacted agencies were notified so appropriate actions could be taken, including any necessary evacuations and the closure of the Mt Crosby Weir Bridge and Fernvale Bridge. The Manual requires the flow at Moggill to be minimised prior to its naturally occurring peak. This requirement was balanced against the need to protect urban areas by releasing water from the Dams in an attempt to keep the Wivenhoe Dam lake below a level that would invoke Strategy W4. Based on an estimated 16 hour travel time between the Dam and Moggill, this did occur. With Dam levels under the Operating Target Line during this period, releases continued from Somerset Dam. Although there was a full awareness of the rainfall forecasts and associated potential flood impacts, the strategy was not to release flows that would cause high level urban inundation until it was certain it could not be avoided. Model results continued to indicate this may be possible.

2 FLOOD EVENT SUMMARY

January 2011 Flood Event – Period 10 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Monday 10 Jan 2011 01:00</p> <p>Completed Monday 10 Jan 2011 09:00</p>	<p>Strategy W3 and Strategy S2 Wivenhoe Directives #8 to #10.</p> <ul style="list-style-type: none"> Gates opened continuously at Wivenhoe Dam for eight hours in accordance with standard gate opening sequence at a rate of 0.5m of opening per hour. Wivenhoe Dam discharge increased from 1,473m³/s to 2,015m³/s. All rural bridges below the Dam were flooded. Further gate openings at Wivenhoe Dam were paused at 09:00 in an attempt to allow the Lockyer Creek and Bremer River peaks to pass Moggill, and to restrict Brisbane River flows at Moggill to 3,500m³/s. This was achieved following discussions with Brisbane City Council that advised a flow of 3,500m³/s at Moggill would fully submerge 322 properties and impact 7,000 properties. No gate movements occurred at Somerset Dam during this period, with Dam levels plotting under the Operating Target Line. This meant the only gate movements allowable at Somerset Dam under Strategy S2 would be openings and this did not happen to limit further rises in Wivenhoe Dam. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 244mm; Somerset Dam 373mm; Lockyer Creek 143mm; Bremer River 120mm. <p>Wivenhoe Dam level rose from 69.97m to 71.56m over the eight-hour period.</p> <p>Somerset Dam level rose from 102.54m to 103.08m over the eight-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 12mm; Somerset Dam 30mm; Lockyer Creek 12mm; Bremer River 18mm. Forecast 24 hour catchment average rainfall at 16:00 on 9 Jan 2011 was 65mm. Estimated peak Wivenhoe Dam level: <ul style="list-style-type: none"> 72.9m (excluding forecast); 74.5m (including forecast). Estimated peak Somerset Dam level: <ul style="list-style-type: none"> 103.1m (excluding forecast); 103.5m (including forecast). Estimated total Dam inflow: <ul style="list-style-type: none"> 1,531,000ML (excluding forecast); 1,985,000ML (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: <ul style="list-style-type: none"> 1,090m³/s (excluding forecast); 2,090m³/s (including forecast). This peak was estimated to occur at 16:00 on 10 Jan 2011. Estimated peak flow at Moggill including Wivenhoe releases: <ul style="list-style-type: none"> 3,420m³/s (excluding forecast); 4,680m³/s (including forecast). 	<p>Strategy W3 and Strategy S2 (Lake level greater than 68.50m, maximum release 4,000m³/s)</p> <ul style="list-style-type: none"> Consideration was given to protecting urban areas from inundation and minimising urban damage. Due to advice received from Brisbane City Council that a flow of 3,500m³/s at Moggill would fully submerge 322 properties and impact 7,000 properties, an attempt was made to remain below this flow level. The approach in the Manual which states the intent of Strategy W3 is to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s, was adopted. Advice received from Brisbane City Council that the upper limit of non-damaging floods was below the 4,000m³/s stated in the Manual was noted and taken into account in the decision making processes. With Dam levels under the Operating Target Line during this period, releases continued from Somerset Dam. Although there was full awareness of the rainfall forecasts and associated potential flood impacts, the strategy was not to release flows that would cause high level urban inundation until it was certain it could not be avoided. Model results continued to indicate this may be possible.

2 FLOOD EVENT SUMMARY

January 2011 Flood Event – Period 11 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Monday 10 Jan 2011 09:00</p> <p>Completed Monday 10 Jan 2011 15:00</p>	<p>Strategy W3 and Strategy S2</p> <ul style="list-style-type: none"> Gate settings at Wivenhoe Dam did not change over this period. Wivenhoe Dam discharge was 2,087m³/s. All rural bridges below the Dam were flooded. At 15:00, the attempt to restrict Brisbane River flows at Moggill to 3,500m³/s was abandoned due to rainfall in the Dam catchments. A new target of 4,000m³/s was set in accordance with the Manual, on the basis that Strategy W3 intends to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s and minimise urban damage. Gate movements at Somerset Dam did not change during this period, with Dam levels plotting under the Operating Target Line. This meant the only gate movements allowable at Somerset Dam under Strategy S2 was openings and this was not done to limit further rises in Wivenhoe Dam. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 274mm; Somerset Dam 407mm; Lockyer Creek 169mm; Bremer River 149mm. <p>Wivenhoe Dam level rose from 71.56m to 72.54m over the six-hour period.</p> <p>Somerset Dam level rose from 103.08m to 103.43m over the six-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 34mm; Somerset Dam 31mm; Lockyer Creek 27mm; Bremer River 30mm. Forecast 24 hour catchment average rainfall at 10:00 on 10 Jan 2011 was 75mm. Estimated peak Wivenhoe Dam level: <ul style="list-style-type: none"> 73.6m (excluding forecast); 75.2m (including forecast). Estimated peak Somerset Dam level: <ul style="list-style-type: none"> 103.4m (excluding forecast); 103.7m (including forecast). Estimated total Dam inflow: <ul style="list-style-type: none"> 1,708,000ML (excluding forecast); 2,162,000ML (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: <ul style="list-style-type: none"> 1,500m³/s (excluding forecast); 2,570m³/s (including forecast). This peak was estimated to occur at 20:00 on 10 Jan 2011. Estimated peak flow at Moggill including Wivenhoe Dam releases: <ul style="list-style-type: none"> 3,910m³/s (excluding forecast); 5,180m³/s (including forecast). 	<p>Strategy W3 and Strategy S2 (Lake level greater than 68.50m, maximum release 4,000m³/s)</p> <ul style="list-style-type: none"> Consideration focused on protecting urban areas from inundation and minimising urban damage. It was decided at 15:00 to attempt to remain below a target flow of around 4,000m³/s at Moggill. Continued to follow the approach in the Manual which states the intent of Strategy W3 is to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s. With Dam levels under the Operating Target Line during this period, releases continued from Somerset Dam. Although there was full awareness of the rainfall forecasts and associated potential flood impacts, the strategy was not to release flows that would cause high level urban inundation until it was certain it could not be avoided. Model results continued to indicate this may be possible.

2 FLOOD EVENT SUMMARY

January 2011 Flood Event – Period 12 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Monday 10 Jan 2011 15:00</p> <p>Completed Monday 10 Jan 2011 20:00</p>	<p>Strategy W3 and Strategy S2 Wivenhoe Directive #11.</p> <ul style="list-style-type: none"> Gates opened continuously at Wivenhoe Dam for five hours in line with standard gate opening sequence, at a rate of 1.0m of opening per hour. Wivenhoe Dam discharge increased from 2,087m³/s to 2,695m³/s. In accordance with the Manual, a target of 4,000m³/s at Moggill was set, on the basis of the intent of Strategy W3 to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s and minimise urban damage. Further gate openings at Wivenhoe Dam were paused at 20:00 in an attempt to allow the Lockyer Creek and Bremer River peaks to pass Moggill and to restrict Brisbane River flows at Moggill to 4,000m³/s. No gate movements occurred at Somerset Dam during this period, with Dam levels plotting under the Operating Target Line. This limited further rises in Wivenhoe. Initial advice on a major flash flood originating in the Lockyer headwaters was received from BoM at 17:32. No volume or flow details were available and gauges in the area were not indicating a significant event. The event would not impact on the Brisbane River for 24 hours. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 279mm; Somerset Dam 415mm; Lockyer Creek 174mm; Bremer River 153mm. <p>Wivenhoe Dam level rose from 72.53m to 73.06m over the five-hour period.</p> <p>Somerset Dam level rose from 103.43m to 103.45m over the five-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 4mm; Somerset Dam 8mm; Lockyer Creek 5mm; Bremer River 3mm. Forecast 24-hour catchment average rainfall at 16:00 on 10 Jan 2011 was 38mm. Estimated peak Wivenhoe level: 73.6m (excluding forecast); 74.3m (including forecast). Estimated peak Somerset level: 103.5m (excluding forecast); 103.5m (including forecast). Estimated total Dam inflow: 1,731,000ML (excluding forecast); 1,982,000ML (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: 1,500m³/s (excluding forecast); 1,840m³/s (including forecast). This peak was estimated to occur at 20:00 on 10 Jan 2011. Estimated peak flow at Moggill including Wivenhoe Dam releases: 3,980m³/s (excluding forecast); 4,470m³/s (including forecast). The extreme rainfall that occurred in Lockyer Creek catchment during this period was not recorded in the remotely-accessible rain gauges in the catchment, and was not indicated on the BoM weather radar. 	<p>Strategy W3 and Strategy S2 (Lake level greater than 68.50m, maximum release 4,000m³/s)</p> <ul style="list-style-type: none"> Consideration focused on protecting urban areas from inundation and minimising urban damage. The target maximum flow at Moggill was now 4,000m³/s. The approach in the Manual which states the intent of Strategy W3 is to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s, continued to be followed. With Dam levels under the Operating Target Line during this period, Somerset Dam releases continued. The reduced rainfall forecast justified retaining the target of 4,000m³/s at Moggill, while the Wivenhoe Dam peak of 74.3m (including forecast) indicated it may be possible to keep urban damage within tolerable limits. A discussion was held with the Dam Safety Regulator to request permission to exceed a level of 74.0m in Wivenhoe Dam for a short period (maximum 12 hours) without invoking Strategy W4, if the safety of the Dam could be guaranteed and urban damage reduced. The Regulator agreed with this approach and provided permission. The strategy continued to not release flows that would cause high level urban inundation until it was certain it could not be avoided. Model results continued to indicate this may be possible.

2 FLOOD EVENT SUMMARY

January 2011 Flood Event – Period 13 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Monday 10 Jan 2011 20:00</p> <p>Completed Tuesday 11 Jan 2011 04:00</p>	<p>Strategy W3 and Strategy S2</p> <ul style="list-style-type: none"> Gate openings at Wivenhoe Dam were paused at 20:00 in an attempt to restrict flows at Moggill to close to 4,000m³/s. There were no changes to gate settings at Wivenhoe Dam over this period. The Dam discharge was 2,726m³/s. In accordance with the Manual, a target flow of 4,000m³/s at Moggill was set on the basis of Strategy W3 to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s. However, Brisbane City Council damage tables indicated this would still impact 5,325 properties and cause damage exceeding \$47.0 million. At 17:32, initial advice was provided about a significant flash flood originating in the Lockyer Creek headwaters. Details were received at 20:00. The focus was on developing strategies to manage these potential flows, however, as any strategy would involve significantly reducing outflows from Wivenhoe Dam, the strategies were not adopted. During this period the plotted dam levels drifted just above the Operating Target Line. This led to a decision at 04:00 to start closing down releases from Somerset Dam to limit further rises in Wivenhoe Dam. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 323mm; Somerset Dam 437mm; Lockyer Creek 186mm; Bremer River 167mm. <p>Wivenhoe Dam level rose from 73.06m to 73.40m over the eight-hour period.</p> <p>Somerset Dam level fell from 103.45m to 103.23m over the eight-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 44mm; Somerset Dam 22mm; Lockyer Creek 12mm; Bremer River 14mm. Forecast 24-hour catchment average rainfall at 16:00 on 10 Jan 2011 was 38mm. Estimated peak Wivenhoe level: 74.1m (excluding forecast); 74.9m (including forecast). Estimated peak Somerset level: 103.5m (excluding forecast); 103.7m (including forecast). Estimated total dam inflow: 2,016,000ML (excluding forecast); 2,267,000ML (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: 1,500m³/s (excluding forecast); 1,810m³/s (including forecast). This peak was estimated to have occurred at 20:00 on 10 Jan 2011. Estimated peak flow at Moggill including Wivenhoe Dam releases: 4,040m³/s (excluding forecast); 4,540m³/s (including forecast). 	<p>Strategy W3 and Strategy S2 (Lake level greater than 68.50m, maximum release 4,000m³/s)</p> <ul style="list-style-type: none"> Consideration focused on protecting urban areas from inundation and minimising urban damage. The target maximum flow at Moggill remained 4,000m³/s. The approach in the Manual which states the intent of Strategy W3 is to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s, continued to be followed. Model results showed a peak level in the Dam close to 74.0m was possible, but appeared increasing unlikely. With Dam levels moving above the Operating Target Line during this period, it was decided to begin closing down releases from Somerset Dam to limit further rises in Wivenhoe Dam. Although there was full awareness of the rainfall forecasts and associated potential flood impacts, the strategy was not to release flows that would cause high level urban inundation until it was certain it could not be avoided. Model results continued to indicate this may be possible however, as rainfall continued, the strategy was reviewed each hour. At 21:00 the Dam Safety Regulator was asked for permission to exceed a level of 74.0m in Wivenhoe Dam for a short period (maximum 12 hours) without invoking Strategy W4, provided the safety of the Dam could be guaranteed. This was considered carefully during the period in view of the continued rainfall.

2 FLOOD EVENT SUMMARY

January 2011 Flood Event – Period 14 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Tuesday 11 Jan 2011 04:00</p> <p>Completed Tuesday 11 Jan 2011 08:00</p>	<p>Transition from Strategy W3 to Strategy W4; and Strategy S2 Wivenhoe Directive #12. Somerset Directive #6.</p> <ul style="list-style-type: none"> Extreme intense rainfall (estimated after the Event to exceed 1 in 500 year intensities) commenced on and close to the Wivenhoe Dam lake area during this period. If the centroid of this rainfall was located further east or south, it may have been possible to avoid transition to Strategy W4. Because the extreme intense rainfall was occurring on and close to the Dam rather than in the northern areas of the Dam catchment, response time was minimised and quick action was needed to protect the safety of the Dam. Accordingly, at 08:00, a decision was made to transition to Strategy W4. Significant urban damage was not to be avoided and the Dam Safety Regulator, Seqwater's CEO and the Councils were advised. Gate settings were not changed at Wivenhoe Dam over this period. Wivenhoe Dam discharge was 2,832m³/s. Sluice gate openings at Somerset Dam were reduced from five to two as the plotted dam levels had drifted just above the Operating Target Line. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 356mm; Somerset Dam 483mm; Lockyer Creek 240mm; Bremer River 183mm. <p>Wivenhoe Dam level rose from 73.40m to 73.70m over the four-hour period.</p> <p>Somerset Dam level rose from 103.23m to 103.46m over the four-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 33mm; Wivenhoe Dam (local) 78mm; Somerset Dam 46mm; Lockyer Creek 54mm; Bremer River 16mm. Forecast 24-hour catchment average rainfall at 16:00 on 10 Jan 2011 was 38mm. Estimated peak Wivenhoe level: 74.5m (excluding forecast); 75.1m (including forecast). Estimated peak Somerset Dam level: 103.9m (excluding forecast); 104.2m (including forecast). Estimated total Dam inflow: 2,210,000ML (excluding forecast); 2,460,000ML (including forecast). Estimated peak flow at Moggill including Wivenhoe Dam releases: 5,870m³/s (excluding forecast). 	<p>Strategy W4 and Strategy S2 (Lake level predicted to exceed 74.00m, no maximum release rate)</p> <ul style="list-style-type: none"> At 08:00, model results showed restricting the peak level in the Dam close to 74.0m was no longer possible due to the high intensity rainfall experienced over this period. At 08:00 it was decided to transition to Strategy W4 and the Dam Safety Regulator, Seqwater's CEO and Councils were advised. It was now apparent significant urban damage resulting from releases from Wivenhoe Dam could not be avoided due to the extreme intense rainfall (estimated after the Event to exceed 1 in 500 year intensities) that commenced on and close to the Wivenhoe Dam lake area during this period. As Dam levels moved above the Operating Target Line during this period, releases from Somerset Dam were progressively closed down to limit further rises in Wivenhoe Dam (sluices were closed down at hourly intervals in accordance with the Manual).

2 FLOOD EVENT SUMMARY

January 2011 Flood Event – Period 15 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Tuesday 11 Jan 2011 08:00</p> <p>Completed Tuesday 11 Jan 2011 13:00</p>	<p>Strategy W4 and Strategy S2 Wivenhoe Directive #12 to #14. Somerset Directive #7.</p> <ul style="list-style-type: none"> Extreme intense rainfall (estimated after the Event to exceed 1 in 500 year intensities) continued on and close to the Wivenhoe Dam lake area during this period. If the centroid of this rainfall was located further east or south, it may have been possible to avoid transition to Strategy W4. Because the extreme intense rainfall was occurring on and close to the Dam rather than in the northern areas of the Dam catchment, response time was minimised and quick action was needed to protect the safety of the Dam. Once Strategy W4 is invoked, the Manual requires the opening of gates in accordance with standard sequences until the storage level of Wivenhoe Dam begins to fall. Accordingly gates were opened continuously at Wivenhoe Dam for five hours in accordance with the standard gate opening sequence at an average rate of 2.0m of opening per hour. This increased the Dam discharge from 2,753m³/s to 4,250m³/s. The threshold limit for urban damage had been exceeded and the lake level continued to rise. During this period Somerset Dam sluice gate openings were closed to limit rises in Wivenhoe Dam in accordance with Strategy S2. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 382mm; Somerset Dam 570mm; Lockyer Creek 287mm; Bremer River 237mm. <p>Wivenhoe Dam level rose from 73.70m to 74.39m over the five-hour period.</p> <p>Somerset Dam level rose from 103.46m to 103.83m over the five-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 27mm; Wivenhoe Dam (local) 85mm; Somerset Dam 86mm; Lockyer Creek 47mm; Bremer River 59mm. Forecast 24-hour catchment average rainfall at 10:00 on 11 Jan 2011 was 100mm. A portion of the extreme intense rainfall in the Dam catchment fell in an un-gauged area (e.g. on the lake area) making it difficult for the model to accurately predict lake level rises. Accordingly, operations at Wivenhoe Dam commenced gauge board readings every 30 minutes during this period and relayed this information to the Flood Operations Centre by telephone. Estimated peak Wivenhoe Dam level: <ul style="list-style-type: none"> 75.0m (excluding forecast); 76.2m (including forecast). Estimated peak Somerset Dam level: <ul style="list-style-type: none"> 104.8m (excluding forecast); 105.7m (including forecast). Estimated total Dam inflow is: <ul style="list-style-type: none"> 2,506,000ML (excluding forecast); 3,123,000ML (including forecast). 	<p>Strategy W4 and Strategy S2 (Lake level predicted to exceed 74.00m, no maximum release rate)</p> <ul style="list-style-type: none"> The strategy was to protect the structural safety of the Dam. The Manual requires actions under Strategy W4 to ensure Wivenhoe Dam gate openings occur in accordance with standard sequences until the storage level of Wivenhoe Dam begins to fall. The Dam level continued to rise at 13:00. During this period, a Dam Operator relayed Wivenhoe Dam gauge board readings to the Flood Operations Centre every 30 minutes. All four Duty Engineers were present in the Flood Operations Centre and flood operations decisions were made every half hour upon receipt of the gauge board readings. With Dam levels above the Operating Target Line during this period, releases from Somerset Dam were closed down (all sluices closed at 10:00) to limit further rises in Wivenhoe Dam.

2 FLOOD EVENT SUMMARY

January 2011 Flood Event – Period 16 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Tuesday 11 Jan 2011 13:00</p> <p>Completed Tuesday 11 Jan 2011 19:00</p>	<p>Strategy W4 and Strategy S2 Wivenhoe Directive #12 to #14.</p> <ul style="list-style-type: none"> • Extreme rapid lake level rises in Wivenhoe Dam continued during this period. The QPF issued at 16:00 was for a catchment average rainfall of 75mm over the next 24 hours. • Gates were opened continuously at Wivenhoe Dam for six hours in accordance with Strategy W4 and the standard gate opening sequence at an average rate of 4.5m of opening per hour. • Wivenhoe Dam discharge was increased from 4,250m³/s to 7,464m³/s. Significant damage to urban areas below Moggill could not be avoided. Estimated peak inflow during this period exceeded 12,000m³/s. • No releases were made from Somerset Dam to limit increases in Wivenhoe Dam in accordance with Strategy S2. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> • Wivenhoe Dam 397mm; • Somerset Dam 610mm; • Lockyer Creek 325mm; • Bremer River 278mm. <p>Wivenhoe Dam level rose from 74.39m to 74.97m over the six-hour period.</p> <p>Somerset Dam level rose from 103.83m to 104.60m over the six-hour period.</p>	<ul style="list-style-type: none"> • Catchment average rainfalls during this period were: <ul style="list-style-type: none"> • Wivenhoe Dam 15mm; • Wivenhoe Dam (local) 35mm; • Somerset Dam 40mm; • Lockyer Creek 38mm; • Bremer River 40mm. • Forecast 24-hour catchment average rainfall at 16:00 on 11 Jan 2011 was 75mm. However, catchment average rainfalls totals this period were: <ul style="list-style-type: none"> • Wivenhoe Dam 8mm; • Wivenhoe Dam (local) 13mm; • Somerset Dam 19mm; • Lockyer Creek 9mm; • Bremer River 8mm. <p>A portion of the extremely intense rainfall in the Dam catchment fell in an un-gauged area (e.g. on the dam lake area) making it difficult for the model to accurately predict lake level rises.</p> <ul style="list-style-type: none"> • Estimated peak Wivenhoe Dam level: 75.0m (excluding forecast); 75.2m (including forecast). • Estimated peak Somerset Dam level: 105.2m (excluding forecast); 105.9m (including forecast). • Estimated total dam inflow: 2,659,000ML (excluding forecast); 3,289,000ML (including forecast). 	<p>Strategy W4 and Strategy S2 (Lake level predicted to exceed 74.00m, no maximum release rate)</p> <ul style="list-style-type: none"> • The strategy was to protect the structural safety of the Dam. • The Manual requires actions under Strategy W4 to ensure Wivenhoe Dam gate openings occur in accordance with standard sequences until the storage level of Wivenhoe Dam begins to fall. • The lake level in both Dams continued to rise during this period. A Dam operator relayed Wivenhoe Dam gauge board readings to the Flood Operations Centre every 30 minutes. All four Duty Engineers were present in the Flood Operations Centre and decisions were made every half hour upon receipt of the gauge board readings. • With Dam levels above the Operating Target Line during this period no releases were made from Somerset Dam to limit further rises in Wivenhoe Dam. • The water level in Wivenhoe Dam peaked at 19:00 on 11 Jan 2011 at 74.97m.

2 FLOOD EVENT SUMMARY

January 2011 Flood Event – Period 17 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Tuesday 11 Jan 2011 19:00</p> <p>Completed Tuesday 11 Jan 2011 21:00</p>	<p>Strategy W4 and Strategy S2 Wivenhoe Directive #15 to #24.</p> <ul style="list-style-type: none"> Gate settings at Wivenhoe Dam did not change over this period. Wivenhoe Dam discharge is 7,458m³/s. The lake level in Wivenhoe Dam stabilised and then fell slightly at 21:00. At the same time a decision was made to close down the gates as quickly as possible to reduce urban flood impacts. This decision required gate openings below minimum recommended settings however, it was made in an attempt to minimise urban damage below Moggill (an objective that has to be considered under Strategy W4). Gates would have been re-opened if further lake level rises were experienced. In accordance with Strategy S2, there were no releases made from Somerset Dam. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 398mm; Somerset Dam 610mm; Lockyer Creek 326mm; Bremer River 278mm. <p>During this two hour period, the lake level in Wivenhoe Dam stabilised at 74.97m and then fell slightly to 74.95m at 21:00.</p> <p>Somerset Dam level rose from 104.60m to 104.78m over the two-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 1mm; Somerset Dam 1mm; Lockyer Creek 1mm; Bremer River 1mm. Forecast 24-hour catchment average rainfall at 16:00 on 11 Jan 2011 was 75mm. A portion of the extreme intense rainfall in the Dam catchment fell in an un-gauged area (e.g. on the dam lake area) which made it difficult for the model to accurately predict lake level behaviour. Estimated peak Wivenhoe Dam level: <ul style="list-style-type: none"> 75.0m (excluding forecast); 75.2m (including forecast). Estimated peak Somerset Dam level: <ul style="list-style-type: none"> 105.2m (excluding forecast); 105.9m (including forecast). Estimated total Dam inflow: <ul style="list-style-type: none"> 2,659,000ML (excluding forecast); 3,289,000ML (including forecast). 	<p>Strategy W4 and Strategy S2 (Lake level predicted to exceed 74.00m, no maximum release rate)</p> <ul style="list-style-type: none"> The strategy was to protect the structural safety of the Dam. The Manual requires actions under Strategy W4 to ensure Wivenhoe Dam gate openings occur in accordance with standard sequences until the storage level of Wivenhoe Dam begins to fall. The Dam level stabilised during this period and then fell slightly at 21:00. A Dam Operator relayed Wivenhoe Dam gauge board readings to the Flood Operations Centre every 30 minutes. All four Duty Engineers were present in the Flood Operations Centre and decisions were made every half hour upon receipt of the gauge board readings. With Dam levels above the Operating Target Line during this period, no releases were made from Somerset Dam to limit further rises in Wivenhoe Dam. The water level in Wivenhoe Dam peaked at 19:00 on 11 Jan 2011 at 74.97m.

2 FLOOD EVENT SUMMARY

January 2011 Flood Event – Period 18 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Tuesday 11 Jan 2011 21:00</p> <p>Completed Wednesday 12 Jan 2011 08:00</p>	<p>Strategy W4 and Strategy S2 Wivenhoe Directive #25 to #34.</p> <ul style="list-style-type: none"> During this period, Wivenhoe Dam gates were closed as quickly as possible without causing rises in the lake level. This was done to reduce urban flood impacts downstream. This decision was made in an attempt to minimise urban damage below Moggill (an objective that must be considered under this strategy). Gates were closed continuously at Wivenhoe Dam for 11 hours in accordance with the standard gate closing sequence, at an average rate of just over 3.6m of opening per hour. Wivenhoe Dam discharge was decreased from 7,464m³/s to 2,547m³/s. All rural bridges below the dam remained flooded and significant damage to urban areas below Moggill had occurred. No releases were made from Somerset Dam in accordance with Strategy S2. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 399mm; Somerset Dam 613mm; Lockyer Creek 328mm; Bremer River 279mm. <p>Wivenhoe Dam level fell from 74.97m to 74.78m over the 11-hour period.</p> <p>Somerset Dam level rose from 104.78m to 105.11m over the 11-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 1mm Somerset Dam 3mm; Lockyer Creek 3m; Bremer River 1m. Forecast 24-hour catchment average rainfall at 16:00 on 11 Jan 2011 was 75mm. Peak Wivenhoe Dam level: 74.97m at 19:00 on 11 Jan 2011. Peak Somerset Dam level: 105.11m at 06:00 on 12 Jan 2011. Estimated total Dam inflow: 2,650,000ML. 	<p>Strategy W4 and Strategy S2 (Lake level predicted to exceed 74.00m, no maximum release rate)</p> <ul style="list-style-type: none"> The strategy was to protect the structural safety of the Dam. The Manual requires actions under Strategy W4 to ensure Wivenhoe Dam gate openings occur in accordance with standard sequences until the storage level of Wivenhoe Dam begins to fall. As the lake level was falling slightly, a decision was made to quickly reduce releases from Wivenhoe Dam to as low a level as possible, to minimise urban damage below Moggill. It was calculated that reducing to a discharge of 2,547m³/s from Wivenhoe Dam would: <ul style="list-style-type: none"> Not increase the downstream flood peak; Not cause the water level in Wivenhoe Dam to rise and; Allow the Dam to be drained back to FSL in seven days, in accordance with the Manual. With Dam levels above the Operating Target Line during this period, no releases were made from Somerset Dam to limit further rises in Wivenhoe Dam.

January 2011 Flood Event – Period 19 of 20

2 FLOOD EVENT SUMMARY

Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Wednesday 12 Jan 2011 08:00</p> <p>Completed Thursday 13 Jan 2011 12:00</p>	<p>Transition from Strategy W4 to the Drain Down Phase Somerset Directives #8 to #9.</p> <ul style="list-style-type: none"> Wivenhoe Dam gate settings did not change over this period. Wivenhoe Dam discharge was 2,534m³/s and all rural bridges below the Dam remained flooded. Releases from Somerset Dam began during this period as the plotted Dam levels fell below the Operating Target Line. These actions were undertaken in accordance with Strategy S2 and to allow the D'Aguilar Highway to be re-opened as soon as possible. Releases from Somerset Dam continued even though plotted Dam levels later rose above the Operating Target Line during this period, to allow the Dam to be drained back to FSL in seven days, in accordance with the Manual. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 401mm; Somerset Dam 619mm; Lockyer Creek 330mm; Bremer River 280mm. <p>Wivenhoe Dam level fell from 74.78m to 74.61m over the 28-hour period.</p> <p>Somerset Dam level fell from 105.11m to 103.96m over the 28-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 2mm; Somerset Dam 6mm; Lockyer Creek 6mm; Bremer River 6mm. Forecast 24-hour catchment average rainfall at 10:00 on 12 Jan 2011 was 10mm. 	<p>Drain Down Phase (Stored floodwaters emptied from the Dam in seven days)</p> <ul style="list-style-type: none"> During this period the strategy transitioned from Strategy W4. The target was to protect the structural safety of the dam to the Drain Down Phase of the Event. Once the Drain Down Phase commenced, the target was to release stored floodwaters from the Dam within seven days of the flood peak passing through the dams, while controlling downstream impacts. Considerations impacting the duration and timing of the Drain Down Phase in this instance included: <ul style="list-style-type: none"> Causing no renewed increases in river levels below the Dam (except where they were unavoidable due to tidal influences); Maintaining an adequate release rate to ensure temporary pumps providing water supplies to the Lowood area could continue to operate; Minimising bank slumping impacts along the river, particularly in key areas such as Coronation Drive (as requested by Brisbane City Council); Re-opening Brisbane Valley Highway and key rural bridges as quickly as possible; Achieving FSL in the Dams at the conclusion of the Event.

January 2011 Flood Event – Period 20 of 20

2 FLOOD EVENT SUMMARY

Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Thursday 13 Jan 2011 12:00</p> <p>Completed Wednesday 19 Jan 2011 12:00</p>	<p>Drain Down Phase Wivenhoe Directives #35 to #62 Somerset Directives #10 to #13.</p> <ul style="list-style-type: none"> During this period, releases from Wivenhoe Dam were increased as the peaks from Lockyer Creek and Bremer River subside. Downstream impacts were controlled to ensure that, at no time during this phase, downstream water levels rose, except if impacted by tidal influences. During this period, stored flood water in Somerset Dam was drained into Wivenhoe Dam in accordance with the drain down target of seven days. Importance was placed on opening the D'Aguilar Highway as soon as possible. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 415mm; Somerset Dam 626mm; Lockyer Creek 337mm; Bremer River 288mm. <p>Wivenhoe Dam level fell from 74.61m to 66.89m over the six-day period.</p> <p>Somerset Dam level fell from 103.96m to 99.00m over the six-day period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this six day period were: <ul style="list-style-type: none"> Wivenhoe Dam 14mm; Somerset Dam 7mm; Lockyer Creek 7mm; Bremer River 8mm. 	<p>Drain Down Phase</p> <ul style="list-style-type: none"> During this period the target was to release stored floodwaters from the Dam within seven days of the flood peak passing through the Dams, while controlling downstream impacts. Considerations impacting the duration and timing of the Drain Down Phase in this instance included: <ul style="list-style-type: none"> Causing no renewed increases in river levels below the Dam (except where unavoidable due to tidal influences); Maintaining an adequate release rate to ensure temporary pumps providing water supplies to the Lowood area could continue to operate; Minimising bank slumping impacts along the river, particularly in key areas such as Coronation Drive (as requested by Brisbane City Council); Re-opening Brisbane Valley Highway and key rural bridges as quickly as possible; Achieving FSL in the Dams at the conclusion of the Event.

3 EVENT MOBILISATION AND STAFFING

3.1 Catchment conditions at Event commencement

In the 25 days leading up to the January 2011 Flood Event, three separate flood events impacted Somerset and Wivenhoe Dams. Flood releases were made from Wivenhoe Dam on all but five of those days. The total outflow from the three additional events was around 690,000ML and the details of these events are as follows:

Event	Event start date	Event end date	Volume released (ML)
1	13/12/2010	16/12/2010	70,000
2	17/12/2010	24/12/2010	150,000
3	26/12/2010	02/01/2011	470,000

During these events, requests were received from Councils and residents, either isolated or adverse, impacted by bridge closures downstream of the Dam, to curtail releases as soon and as quickly as possible. This was a significant issue at the time as bridge closures had occurred over the traditional Christmas/New Year holiday period, including closures on Christmas and New Year's Day. However releases during these events were always made in accordance with the Manual.

Less than four days separated the end date of Event 3 and the commencement of the January 2011 Flood Event. This meant that any significant drain down of Somerset and Wivenhoe Dams during this period was impossible without causing significant bridge inundation downstream of the Dam and without exceeding minor flood levels in the Lower Brisbane River. These actions were not able to be justified by the Manual, particularly as Section 8.3 states the following in relation to Wivenhoe Dam:

"The spillway gates are not to be opened for flood control purposes prior to the reservoir level exceeding EL 67.25."

This issue is also discussed in Section 17.0.

Finally, due to the rainfall that occurred in the Dam catchments throughout December 2010, at the start of the January 2011 Flood Event, the catchment conditions were near saturation. However, the catchment was highly responsive, with the initial loss varying between 0 and 30mm. Continuing loss rates were also unusually low. Because the degree of catchment saturation increased as the Event progressed, very high levels of run-off generation were experienced throughout the Event.

3 EVENT MOBILISATION AND STAFFING

3.2 Event mobilisation

There was no significant rainfall in the 24 hours to 09:00 on Wednesday 5 January 2011 however, in the 24 hours to 08:00 Thursday 6 January 2011, catchment average rainfall totals were:

- Wivenhoe Dam 28mm;
- Somerset Dam 21mm;
- Lockyer Creek 23mm;
- Bremer River 23mm.

Deleted:

Deleted: on

Deleted:

This rainfall was sufficient to trigger event mobilisation at 07:42 Thursday 6 January 2011, using Strategies W1A and S2. Based on the rainfall at that time and subsequent model runs, the Somerset lake level was forecast to peak at 99.7m (excluding forecast) and 100.0m (including forecast). The Wivenhoe lake level was forecast to peak at 68.3m (excluding forecast) and 68.4m (including forecast).

Deleted: which occurred

Deleted: on

Deleted:

Deleted:

The following actions were undertaken as soon as mobilisation occurred:

- 24/7 staffing commenced at the Flood Operations Centre with at least one Duty Flood Operations Engineer and at least one trained Flood Officer present (minimum two persons);
- 24/7 staffing commenced at the Dams with at least two trained Dam Operators present;
- The one absent Flood Operations Engineer was called back early from annual leave to assist with the management of the Event.

Deleted:

Staffing of the Flood Operations Centre and the Dams continued on this basis until event de-mobilisation at 12:00 Wednesday 19 January 2011. During critical periods, all four Flood Operations Engineers were present in the Flood Operations Centre and were actively involved in flood event decision making processes. These Engineers generally lived in the Flood Operations Centre building during the critical 96 hours of the Event, as did a number of the trained Flood Officers.

3.3 Qualifications of staff on duty

Flood Operations Engineers

The four Flood Operations Engineers approved by the Chief Executive to direct the operations of Somerset and Wivenhoe Dams during flood events are:

- Flood Operations Engineer 1
- Flood Operations Engineer 2
- Flood Operations Engineer 3
- Flood Operations Engineer 4

The approved Engineers all hold a current Certificate of Registration as a Registered Professional Engineer of Queensland, as well as tertiary degrees in engineering. All Engineers had demonstrated to the Chief Executive they have:

Deleted: e

Deleted: Officer

1. Knowledge of design principles related to the structural, geotechnical and hydraulic design of large dams, and;
2. At least a total of five years suitable experience, having demonstrated their expertise in at least two of the following areas:

Deleted: and have

- Investigation, design or construction of major dams;
- Operation and maintenance of major dams;
- Hydrology with particular reference to flooding, estimation of extreme storms, water management or meteorology;
- Applied hydrology with particular reference to flood forecasting and/or flood forecasting systems.

3 EVENT MOBILISATION AND STAFFING

Flood Operations Engineers 1, 2 and 3 are three of the most experienced and expert Engineers in the industry, in relation to their knowledge of Brisbane River flood hydrology. Flood Operations Engineer 4 is one of the most experienced Engineers in Australia in relation to the operation and maintenance of gated dams. The Flood Operations Engineers' resumes are included in Appendix N.

Deleted: e

Deleted: e

Formatted: Font color: Red

Flood Officers

Nine Flood Officers, trained in Flood Operations Centre duties, assisted in the Flood Operations Centre during the Event.

1. Flood Officer 1;
2. Flood Officer 2;
3. Flood Officer 3;
4. Flood Officer 4;
5. Flood Officer 5;
6. Flood Officer 6;
7. Flood Officer 7;
8. Flood Officer 8;
9. Flood Officer 9.

Deleted:

Dam Operators

Thirteen Dam Operators, trained in Flood Operations Centre duties, operated Somerset and Wivenhoe Dams during the Event.

1. Dam Operator 1;
2. Dam Operator 2;
3. Dam Operator 3;
4. Dam Operator 4;
5. Dam Operator 5;
6. Dam Operator 6;
7. Dam Operator 7;
8. Dam Operator 8;
9. Dam Operator 9;
10. Dam Operator 10;
11. Dam Operator 11;
12. Dam Operator 12;
13. Dam Operator 13.

3 EVENT MOBILISATION AND STAFFING

3.4 Flood Operations Centre staffing

Flood Operations Centre staffing details for the duration of the Event are recorded in Tables 3.3.1, 3.3.2 and 3.3.3 below. Each table has been compiled in accordance with the confirmed Event Roster.

Shift start time	Shift finish time	Flood Operations Engineers	Notes
Thu 06/01/2011 07:00	Thu 06/01/2011 19:00	Engineer 2	Standard shift handovers occurred at either end of this shift in accordance with the Flood Procedure Manual.
Thu 06/01/2011 19:00	Fri 07/01/2011 07:00	Engineer 1	Standard shift handovers occurred at either end of this shift in accordance with the Flood Procedure Manual.
Fri 07/01/2011 07:00	Fri 07/01/2011 19:00	Engineer 2	Standard shift handovers occurred at either end of this shift in accordance with the Flood Procedure Manual.
Fri 07/01/2011 19:00	Sat 08/01/2011 07:00	Engineer 3	Standard shift handovers occurred at either end of this shift in accordance with the Flood Procedure Manual.
Sat 08/01/2011 07:00	Sat 08/01/2011 19:00	Engineer 1	Standard shift handovers occurred at either end of this shift in accordance with the Flood Procedure Manual.
Sat 08/01/2011 19:00	Sun 09/01/2011 07:00	Engineer 4	Standard shift handovers occurred at either end of this shift in accordance with the Flood Procedure Manual.
Sun 09/01/2011 07:00	Sun 09/01/2011 19:00	Engineer 2	A meeting of all four Flood Operations Engineers was held at 15:30 to discuss strategy and the developing situation. Additionally, standard shift handovers occurred at either end of this shift in accordance with the Flood Procedure Manual.
Sun 09/01/2011 19:00	Mon 10/01/2011 07:00	Engineer 3 Engineer 1	Due to the developing rainfall scenario, Engineer 2 assisted until 22:00 on 09/01/2011 to provide an extended shift handover at the commencement of this shift. It was also decided at this time to have two Engineers on duty until the peak of the Event had passed. The handover at the end of this shift involved all four Flood Operations Engineers discussing strategy and the developing situation.
Mon 10/01/2011 07:00	Mon 10/01/2011 19:00	Engineer 2 Engineer 4	The handover at either end of this shift involved all four Flood Operations Engineers discussing strategy and the developing situation.
Mon 10/01/2011 19:00	Tue 11/01/2011 07:00	Engineer 3 Engineer 1	The handover at either end of this shift involved all four Flood Operations Engineers discussing strategy and the developing situation.

Table 3.3.3 - Flood Operations Centre staffing - Wivenhoe Dam Operators

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHECKED DATA

4 FLOOD EVENT PROCEDURES

4.1 Introduction

Seqwater has prepared a Flood Procedure Manual that assigns responsibilities to Seqwater personnel around flood event preparation, mobilisation and operation, in relation to Seqwater's Dams, including Somerset and Wivenhoe Dams.

The relationship between the Flood Procedure Manual and *The Manual of Operational Procedures for Flood Mitigation at Wivenhoe Dam and Somerset Dam* is outlined in Figure 4.1.1.

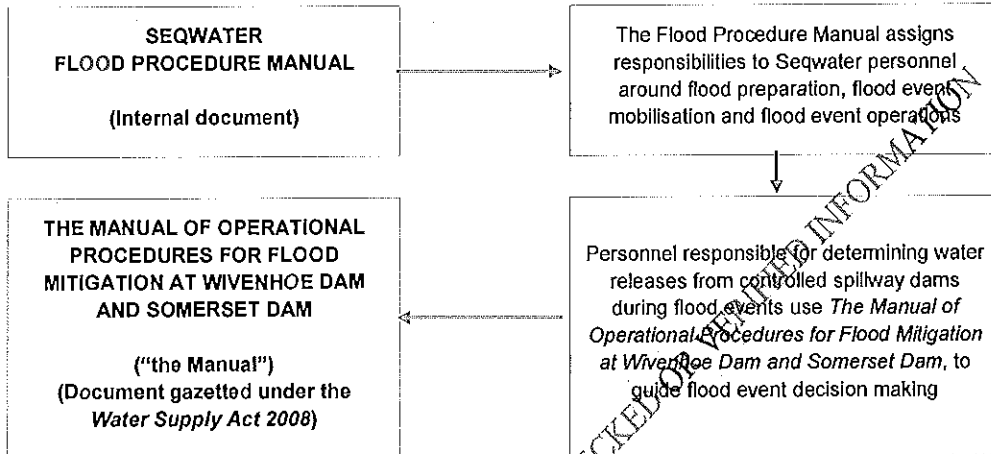

Figure 4.1.1 – Relationship between the Flood Procedure Manual and The Manual of Operations Procedures for Flood Mitigation at Wivenhoe Dam and Somerset Dam

The Flood Procedure Manual is an internal document and is registered in Seqwater's internal document control system (Qpulse). Controlled hardcopies are issued to the following personnel:

Agency	Responsible person	Location
Seqwater	Dam and Source Operations Manager	Margaret Street, Brisbane
Seqwater	Principal Hydrologist	Margaret Street, Brisbane
Seqwater	Senior Flood Operations Engineer	Flood Operations Centre, Brisbane
Seqwater	Principal Engineer Dam Safety	Karalee
Seqwater	Operations Coordinator, South	Karalee
Seqwater	Operations Coordinator, North	Landers Shute
Seqwater	Operations Coordinator, Central	Wivenhoe Dam
Seqwater	Storage Supervisor	Wivenhoe Dam
Seqwater	Storage Supervisor	Leslie Harrison Dam
Seqwater	Storage Supervisor	North Pine Dam
Seqwater	Storage Supervisor	Somerset Dam

Table 4.1.2 – Location of controlled hardcopies of the Seqwater Flood Procedure Manual

The issue date for the current Flood Procedure Manual is January 2010.

4 FLOOD EVENT PROCEDURES

4.2 Flood Operations Centre preparedness

~~Prior to the January Flood Event, Flood Operations Engineer 2 was designated the Flood Operations Manager in accordance with the requirements of the Seqwater Flood Procedure Manual. In conjunction with Flood Operations Engineer 1 (a Senior Flood Operations Engineer), Flood Operations Engineer 2 was responsible for the overall management of the Flood Operations Centre leading up to the Event and ensured:~~

Deleted: as
Formatted: Font color: Auto
Deleted: one of the
Deleted: s

- A Flood Operations Engineer and three Flood Officers were on close call at all times, and ready to attend the Flood Operations Centre if called;
- Sufficient Flood Operations Engineers and Flood Officers were available to staff the Flood Operations Centre if a flood event was declared;
- Contact details for Flood Operations Engineers and Flood Officers were up-to-date;
- Current copies of the following documents were available in the Flood Operations Centre:
 - *The Manual of Operational Procedures for Flood Mitigation for Wivenhoe Dam and Somerset Dam (Revision 7)* ("the Manual");
 - Wivenhoe Dam – Emergency Action Plan;
 - Somerset Dam – Emergency Action Plan.
- The following facilities were available in the Flood Operations Centre:
 - The data collection and modelling systems required to manage flood events at Somerset and Wivenhoe Dams;
 - Sufficient stationary and forms;
 - Landline telephone, mobile telephone, satellite telephone, Seqwater radio network, facsimile and email communication systems;
 - Power systems and back-up power systems required to ensure computer system reliability during the Flood Event.

~~As defined by the Seqwater Flood Procedure Manual, the role and responsibilities of the Flood Operations Manager are completely separate to the roles and responsibilities of Flood Operations Engineers. However, a single person can hold both roles at any point in time.~~

Deleted: It should be noted that the role of t
Deleted: as defined by the Seqwater Flood Procedure Manual

Deleted: Senior Flood Operations Engineers and
Deleted: as defined by the Manual. Although the

~~When one of the Flood Operations Engineers is on call, this person is referred to as the Duty Flood Operations Engineer. There is always a single designated Duty Flood Operations Engineer on call 24 hours a day, seven days a week.~~

~~When on call, the Duty Flood Operations Engineer – one of the four Flood Operations Engineers described in Section 3.3 – ensured they:~~

- Were contactable at all times by telephone;
- Had constant access to facilities that provided appropriate real-time monitoring of dam and catchment conditions;
- Were able to travel to the Flood Operations Centre in two hours to direct the mobilisation and operation of the Flood Event, without compromising the safety of the Dams or the intent of the Manual;
- As incoming Duty Flood Operations Engineer, organised the handover from the current duty staff;
- As outgoing Duty Flood Operations Engineer, prepared a status summary sheet for Somerset and Wivenhoe Dams;
- Contacted the Flood Operations Manager if any issues arose with the potential to adversely impact the operations of Flood Operations Centre.

~~When on call, the nine Flood Officers described in Section 3.3 ensured they:~~

- Were contactable at all times by telephone;
- Reported to the Duty Flood Operations Engineer if at any time while being on call they became unfit for duty;

4 FLOOD EVENT PROCEDURES

- Were able to travel to the Flood Operations Centre within two hours of being called;
- Attended the close call handover meetings organised by the Duty Flood Operations Engineers.

4.3 Flood Operations Centre mobilisation

The Seqwater Flood Procedure Manual requires the Duty Flood Operations Engineer to declare a flood event and mobilise the Flood Operations Centre, if the Duty Flood Operations Engineer considers it likely the FSL of Somerset Dam or Wivenhoe Dam will be exceeded as a result of rainfall occurring in the Dam catchments and flood releases are likely. The Flood Operations Centre is mobilised as soon as a flood event is declared. Flood Operations Engineer 2 was the Duty Flood Operations Engineer who declared the January 2011 Flood Event by email at 07:42 on Thursday 6 January 2011 (see Appendix H).

Deleted: When on call, a Senior Flood Operations Engineer or Flood Operations Engineer is referred to as the Duty Flood Operations Engineer. There is always a single Duty Flood Operations Engineer on call at all times, 24 hours a day, seven days a week.¶

When the Flood Operations Centre was mobilised, the Duty Flood Operations Engineer ensured that the following actions were undertaken:

Deleted: also

Deleted: . This occurred

- Notified the Senior Flood Operations Engineers of the mobilisation;
- Commenced recording significant events in the Event Log;
- Contacted the required Flood Officers to commence duty at the Flood Operations Centre;
- Contacted the Seqwater Operations Coordinator responsible for Somerset Dam and Wivenhoe Dam, and provided instructions to send Dam operations staff to the Dams. The Operations Coordinator was also advised of the expected duration of the Flood Event to allow time to organise suitable staffing arrangements for the duration of the Event;
- Established 09:00, Sunday 2 January 2011 as the start time for the Event, for the purposes of modelling predictions;
- Established a suitable directory structure within the computer network to manage the Flood Event data;
- Examined and cleaned all rainfall and stream flow data for the Event prior to use in the flood modelling systems;
- Derived inflow hydrographs for:
 - Wivenhoe Dam;
 - Somerset Dam;
 - Lockyer Creek catchment;
 - Bremer River catchment;
- Examined these derived inflow hydrographs across a variety of appropriate rainfall scenarios;
- Inputted the derived inflow hydrographs for Somerset Dam, Wivenhoe Dam, Lockyer Creek catchment and Bremer River catchment into Somerset and Wivenhoe Dams operations spreadsheet and ran this program;
- Determined gate operations strategies for Somerset and Wivenhoe Dams based on the resulting data from the operations spreadsheet and in accordance with the strategies outlined in the Manual;
- Advised Brisbane City Council, Ipswich City Council and Somerset Regional Council of the gate operations strategies to allow roads to be closed prior to inundation;
- Directed gate operations at the Dams as appropriate by instructing the Dam Supervisors by email and facsimile of gate movements. Instructions were also given verbally by telephone prior to written instructions being released;
- Advised Seqwater's Dam and Source Operations Manager of gate operations by providing a copy of all Flood Operations Directives and regular updates, including advice of longer term strategies to manage the Flood Event. This allowed Seqwater to provide appropriate flood event advice to the public and other stakeholders, including the Queensland Water Commission and the Water Grid Manager;
- Advised the Bureau of Meteorology, Brisbane City Council and the Dam Safety Regulator of the gate operations strategies and actual and projected water releases from Wivenhoe Dam.

4 FLOOD EVENT PROCEDURES

4.4 Flood Operations Centre operations

During the Flood Event, the four Flood Operations Engineers worked closely together to ensure the following took place, in accordance with the Flood Procedure Manual:

- Suitable staffing arrangements were in place for the Flood Operations Centre and the impacted Dams for the duration of the Flood Event;
- Staff working in the Flood Operations Centre during the Event signed the Flood Event Shift Log at the start and end of a shift. However, because a number of staff were living in the building housing the Flood Operations Centre during the Event, some sign on and sign off details were not properly recorded. This has been recognised as an area for improvement for future flood events.

During the Flood Event, the Senior Flood Operations Engineer set the overall strategy for the management of the Flood Event in accordance with the Manual. The Duty Flood Operations Engineers directed the operations of the Flood Control Centre in accordance with the overall strategy. In situations where two or more Flood Operations Engineers were on duty simultaneously, these duties were shared equally. The Duty Flood Operations Engineers ensured the following actions took place during the Event, in accordance with the Flood Procedure Manual:

- All significant events were recorded in the Event Log;
- The integrity of the ALERT System was maintained;
- Flood releases from the Dams were in accordance with the Manual, and the RTFM was used to support the decision making processes around the releases;
- Software issues impacting on the operation of the ALERT System were identified and resolved.
- All notifications specified in the Flood Manuals and Emergency Action Plans were recorded in the Event Log;
- Accurate plots of headwater levels were maintained for each of the Dams;
- Appropriate handovers took place at the end of each shift to ensure incoming Officers had the following information:
 - Reservoir storage elevations at each Dam;
 - Radial gate, sluice gate and regulator valve openings at each Dam;
 - Flood release procedures being applied and the reason for their selection;
 - Status of compliance with the Flood Manuals and Emergency Action Plans;
 - Status of the communication systems;
 - Status of the data gathering network;
 - Status of computer systems and Flood Modelling Systems;
 - Any areas of concern associated with the management of the Flood Event;
 - Areas in which the discretion has been exercised in accordance with the Flood Manuals.
- Flood Officers on duty in the Flood Operations Centre undertook all duties as directed by the Duty Flood Operations Engineer;
- Brisbane City Council, Ipswich City Council and Somerset Regional Council were contacted as appropriate to allow roads to be closed prior to inundation and for any necessary arrangements to be made for community isolation and/or necessary evacuations. (The Manual allows for immediate releases to be initiated if the safety of a Dam is at risk. However, in accordance with Seqwater's duty of care to public safety when making Dam releases, every attempt is made to close impacted roads prior to inundation by water outflows from gate operations, and to make appropriate arrangements for community isolation and evacuations due to the risk to public safety.)
- Gate operations were directed at the Dams as appropriate, by instructing the Dam Supervisors by email and facsimile about gate movements. Instructions were also explained verbally by telephone prior to the written instructions being released;
- Seqwater's Dam and Source Operations Manager was advised of all gate operations by providing a copy of all Flood Operations Directives and regular updates, including advice of longer-term strategies to

Deleted: because of

4 FLOOD EVENT PROCEDURES

manage the Flood Event. This allowed Seqwater to provide appropriate flood event advice to the public and other stakeholders, including the Queensland Water Commission and the Water Grid Manager;

- The Bureau of Meteorology, Brisbane City Council and the Dam Safety Regulator were advised of the gate operation strategies and actual and projected water releases from Wivenhoe Dam.

As the flood event progressed a number of issues arose including the potential for the Flood Operations Centre to lose mains power and a breakdown in communication between the main and back-up Flood Operations Centres. These issues were addressed through the procedures outlined above and the respective building managers and Energex were aware of the critical nature of the function of the FOC. The main FOC located in Turbot Street did not lose mains power or telephone communications throughout the event, whilst the Back-up facility, located in George Street did resort to standby power for the period the CBD was affected by the flood. This did result in the wireless bridge which links the main and back-up FOCs dropping out for a short period of time, but this link was quickly re-established once the standby power was

4 FLOOD EVENT PROCEDURES

4.5 Somerset Dam and Wivenhoe Dam preparedness

Prior to the Flood Event, the Seqwater Operations Coordinator responsible for Somerset and Wivenhoe Dams ensured the following actions took place during in accordance with the Flood Procedure Manual:

Deleted: and Somerset Dam
Deleted: the Event

- At least two Dam Operators were on close call for both Somerset Dam and Wivenhoe Dam at all times;
- Sufficient Dam Operators were available to staff Somerset Dam and Wivenhoe Dam should a major flood event be declared;
- Contact details for the Dam Operators were up to date;
- Current copies of the following documents were available at Somerset Dam and Wivenhoe Dam:
 - The Manual of Operational Procedures for Flood Mitigation for Wivenhoe Dam and Somerset Dam (Revision 7);
 - Emergency Action Plan;
 - Standing Operating Procedures;
 - Operation and Maintenance Manual.
- The following facilities were available at Somerset Dam and Wivenhoe Dam:
 - Sufficient stationary and forms;
 - Landline telephone, mobile telephone, satellite telephone, Seqwater radio network, facsimile and email communication systems;
 - Power systems and back-up power systems to ensure computer systems and communication systems were able to operate reliability during the Flood Event.
- All preventive maintenance work was undertaken at both Dams in accordance with the Dam Operation and Maintenance Manuals.
- The flood release infrastructure and associated back-up systems at both Dams was kept operationally-ready;
- While on close call, Dam Operators ensured:
 - They were contactable at all times by telephone;
 - In the event of being "unfit for duty" they reported to the Duty Flood Operations Engineer currently on close call;
 - They were able to travel to the Dam they were assigned to within two hours of being called.

4 FLOOD EVENT PROCEDURES

4.6 Somerset Dam and Wivenhoe Dam mobilisation

Following notification the Flood Event had been declared, the Seqwater Operations Coordinator responsible for Somerset Dam and Wivenhoe Dam, ensured the following actions were completed in accordance with the Flood Procedure Manual:

- The Principal Engineer Dam Safety was notified of the mobilisation;
- Significant events were recorded in the Event Log;
- The Dam Operators on close call were contacted and directed to travel to the Dams. Two Dam Operators were directed to each site and at least two Dam Operators remained on duty at all times during the Event;
- During each shift, Dam Operators were nominated to be the Dam Supervisors for the purposes of managing the Flood Event.

As each Dam Supervisor arrived at their assigned Dam, the Dam Supervisor completed the following actions in accordance with the Flood Procedure Manual:

- Checked communication existed with the Flood Operations Centre;
- Commenced recording significant events in the Event Log;
- Completed the Flood Readiness Checklist contained in the Flood Procedure Manual (see Appendix I);
- Undertook flood operations as directed by the Flood Operations Centre

Deleted: F
Deleted: O

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHECKED OR VERIFIED INFORMATION

4 FLOOD EVENT PROCEDURES

4.7 Somerset Dam and Wivenhoe Dam operations

As the Flood Event commenced, the Dam Supervisor at Somerset Dam and Wivenhoe Dam ensured the following actions took place in accordance with the Flood Procedure Manual. At the beginning of each shift, a new Dam Supervisor was appointed.

- All significant events were recorded in the Event Log;
- Flood releases were undertaken in accordance with directions provided by the Flood Operations Centre;
- All notifications required by the Manuals and Emergency Action Plans were made;
- Handovers at the end of each shift were conducted to ensure incoming Officers were aware of:
 - Reservoir storage elevations at each Dam;
 - Radial gate, sluice gate and regulator valve openings at each Dam;
 - Status of the communication systems;
 - Any areas of concern associated with the management of the Flood Event.
- The Duty Flood Operations Engineer was advised of any issues arising during the Event with the potential to adversely impact flood operations.

(Note: During the Event, Wivenhoe Dam experienced a temporary loss of mains power however, this did not impact Dam operations as the on-site, standby diesel generator provided full power during this time. Two other separate back-up power systems were also available to ensure the continued operation of the radial gates if needed.)

Deleted: d

5 DATA COLLECTION SYSTEM PERFORMANCE

5.1 Background

A real time flood monitoring and forecasting system has been established to monitor rainfall and water levels in the Dam catchments and to provide adequate, accurate and timely information for informed decision-making.

Field stations consisting of rainfall and water level gauges use the Event Reporting Radio Telemetry System (ERRTS) to communicate data to the Flood Operations Centre. More than one gauge may be located at an individual field station. Water level gauges are often located at the Department of Environment and Resource Management (DERM) gauging stations; DERM is responsible for the maintenance of the water level gauges and Seqwater for the ERRTS equipment.

Rainfall gauges consist of a standard tipping bucket. Water level gauges vary in type and model but include shaft encoders, wet pressure transducers and dry pressure transducers. At a rainfall gauge, an event is defined as the tip of the bucket. At a water level rainfall gauge, an event is defined as an incremental increase or decrease in water level.

When an event is triggered at a gauge, data is transmitted via VHF radio through a series of redundant radio repeaters to the Flood Operations Centre and other data collection centres. Each signal has a unique identification number. When the signal arrives at the Flood Operations Centre base station, they are relayed to computer hardware platforms serial port via a decoder, time stamped, read, decoded, accepted or rejected, filtered, validated and then stored in a gauge database in the Centre's Flood-Col and Enviromon databases. Redundant base stations at Mineral House and the Land Centre in Brisbane's CBD are synchronised with the Flood Operations Centre data base.

The Flood-Col and Enviromon databases contain gauge details including:

- Gauge name;
- ALERT number;
- Type of gauge;
- Calibration information;
- Alarm thresholds;
- Rating curve information, if applicable.

Both Flood-Col and Enviromon allow filtered gauge data to be viewed in either a text or graphical format. Information that can be viewed or edited includes height, discharge, rainfall pluviographs, rainfall hyetographs, lake levels and Dam volumes and applications are also available for viewing groups of gauges.

The combination of ERRTS field stations, rainfall gauges and water level gauges, radio network and data collection software is an ALERT system. ALERT or Automated Local Evaluation in Real Time System, has become a standard for flood warning system in Australia and the United States of America and is widely used by the Bureau of Meteorology (BoM) and other flood warning agencies throughout the world.

Flood-Ops is the modelling software used to analyse and produce forecast runoff. It extracts data from the Flood-Col database, calculates areal rainfalls and generates hydrographs of runoff. Model parameters can be adjusted and forecast rainfall included as an option. Results can be displayed and imported into gate operation models. The ALERT system, Flood-Ops and ancillary software make up the Real Time Flood Model (RTFM).

5 DATA COLLECTION SYSTEM PERFORMANCE

5.2 Field station descriptions

Seqwater operates 75 rain gauges and 71 river gauge field stations within and around the Brisbane River Basin. Of these 146 sites, 129 operate under the ALERT system and the remaining 17 operate as telephone telemeter gauging stations, but are not directly available in the operational suite.

Manual gauge board readings are taken at Somerset and Wivenhoe Dams to confirm the ALERT data received from these sites. These manual observations form the basis of gate operations.

In addition to the Seqwater owned and operated network, the Flood Operations Centre also has access to Enviromon which collects data from an additional 225 rain gauges and nearly 200 water level gauges throughout South East Queensland.

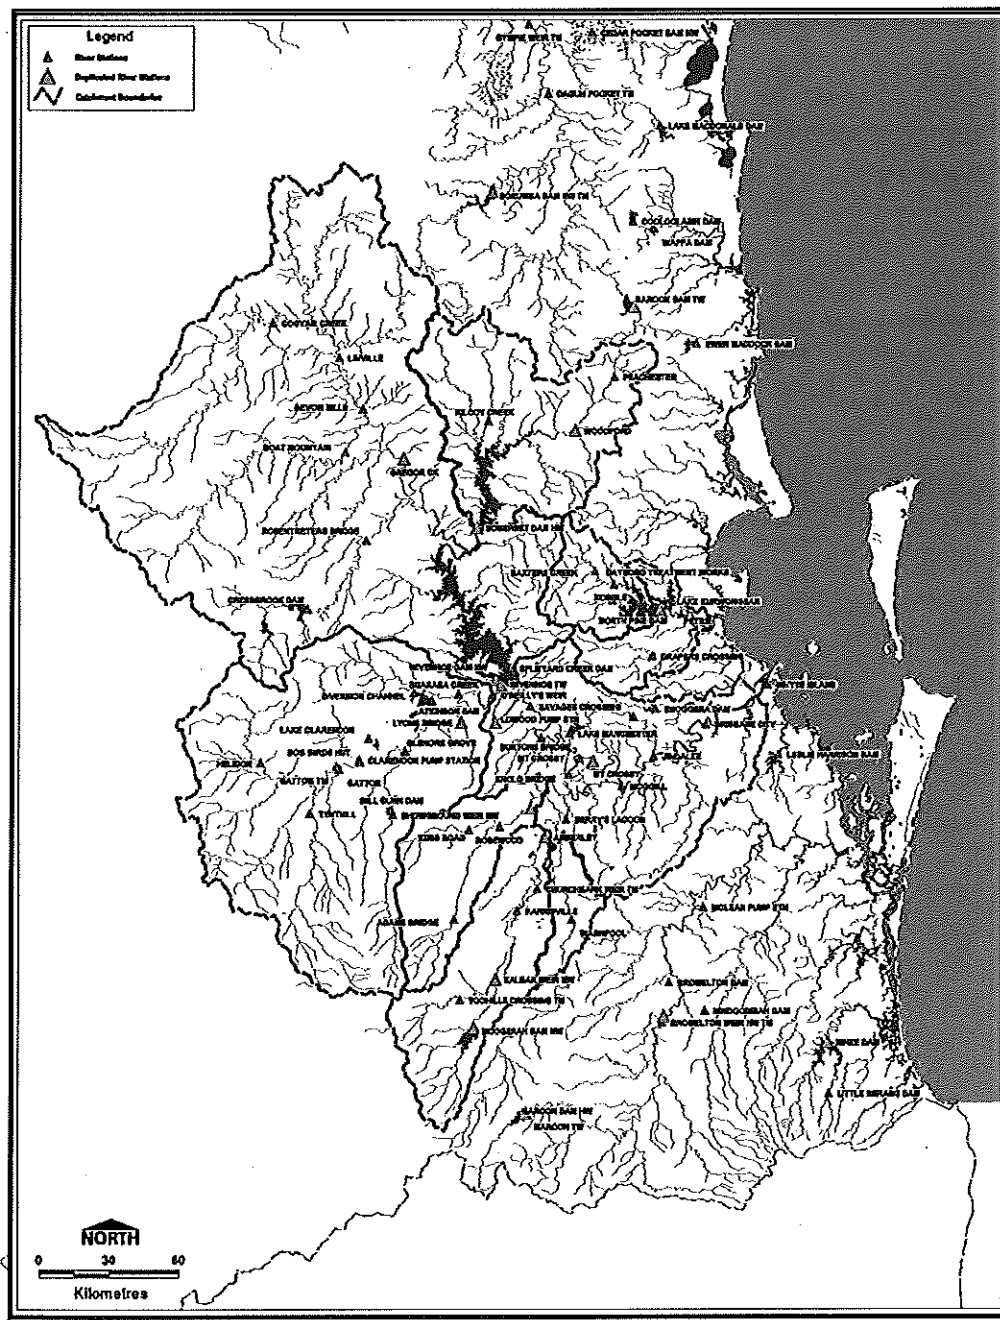

The location of the rainfall stations are shown in Figure 5.2.1 and the Seqwater water level network is shown in Figure 5.2.2.

5 DATA COLLECTION SYSTEM PERFORMANCE

Formatted: Do not check spelling or grammar

Figure 5.2.2 – Seqwater water level network as at January 2011

Deleted: ALERT

Prior to the January 2011 floods, four out of 75 rain gauges (95% availability) and six out of 71 river gauges (92% availability) were marked as being 'out of action'. In line with standard practice, the data collected from some gauges was also marked as 'suspect' at that time, and therefore required examination prior to being used in modelling. These gauges are listed in Table 5.2.3 and Table 5.2.4.

5 DATA COLLECTION SYSTEM PERFORMANCE

In many instances, more than one gauge is located on an individual station site to allow for the periodic non-operation of individual gauges. Accordingly, due to this in-built network redundancy, the presence of these non-operational gauges did not impact on data quality during the Event.

Rain ID	Site	Status date 6 Jan 2011	Comment
6517	Gregors Creek AL-B	Out of action	Redundant gauge. Another rainfall gauge is available at this site.
6526	Helidon AL	Out of action	Data from adjacent stations at Toowoomba and Gatton was used as a substitute for this data. However, data from this station was available for use through the BoM Environmon system.
6600	Kilcoy AL	Suspect	Although this data was marked suspect and was missing occasional observations, upon review, the data appeared correct and was used in modelling.
6736	Kuss Road AL	Out of action	This site is located in the Bremer River catchment and the data is of limited value in gate operations decision making.
6646	Lowood AL-B (pump station)	Suspect	Although this data was marked suspect and was missing occasional observations, upon review, the data appeared correct and was used in modelling. This gauge is also a redundant gauge. Another rainfall gauge is available at this site.
6621	Nukinenda AL	Suspect	Although this data was marked suspect and was missing occasional observations, upon review, the data appeared correct and was used in modelling.
6559	Savages Crossing AL	Suspect	Although this data was marked suspect and was missing occasional observations. Upon review the data appeared correct and was used in modelling.
6593	Somerset Dam HW AL-P	Suspect	Although this data was marked suspect and was missing occasional observations, upon review, the data appeared correct and was used in modelling. This gauge is also redundant gauge. Another rainfall gauge is available at this site and manual readings are also available.
6995	Somerset Dam HW AL-B2	Suspect	Redundant gauge. Another dam height gauge is available at this site and manual readings are also available.
6565	Tenthill AL	Suspect	Although this data was marked suspect and was missing occasional observations, upon review, the data appeared correct and was used in modelling.
6602	Top of Brisbane AL	Suspect	Although this data was marked suspect and was missing occasional observations, upon review, the data appeared correct and was used in modelling.
6744	Wilson's Peak AL	Out of action	Data from adjacent stations at Tarome and Kalbar was used as a substitute for this data.
6540	Yarraman AL	Suspect	Although this data was marked suspect and was missing occasional observations, upon review, the data appeared correct and was

Deleted: n

5 DATA COLLECTION SYSTEM PERFORMANCE

used in modelling.

Table 5.2.3 – Rainfall gauges marked out of action or suspect at Flood Event commencement

River ID	Site	Status date 6 Jan 2011	Comment
6654	Amberley AL-B	Out of action	Redundant gauge. Another stream height gauge is available at this site. This station has been marked for relocation.
6652	Amberley AL-P	Suspect	This data was marked suspect as it was reporting at a high frequency however, upon review, the data appeared correct and was used in modelling.
6524	Cressbrook Dam AL	Out of action	The downstream stream height gauge at Rosentretter provides more useful information than this site.
6518	Gregors Creek AL-B	Out of action	Redundant gauge. Another river height gauge is available at this site.
6650	Lowood AL-P	Out of action	Redundant gauge. Another river height gauge is available at this site.
6631	Lyons Bridge AL-B	Suspect	This data was marked suspect as it was reporting erratically however, upon review, the data appeared correct and was used in modelling. Additionally, this is a redundant gauge. Another river height gauge is available at this site.
6594	Somerset Dam HW AL-P	Suspect	This is a redundant gauge. Another dam height gauge is available at this site and manual readings are also available. Only a slight difference was noted between this gauge and the manual observations.
6566	Tenthill AL	Out of action	The downstream stream height gauge at Galton provides more useful information than this site.
6743	Walloon AL-B	Out of action	This is a redundant gauge. Another river height gauge is available at this site.
6642	Wivenhoe Dam TW AL-B	Suspect	Gate settings and discharge curves provide more accurate flow estimates than this gauge during flood releases.

Deleted: rainfall gauge

Table 5.2.4 – Water Level gauges marked out of action or suspect at Flood Event commencement

The January 2011 floods damaged a number of stations. After the Event, eight out of 75 rain gauges (89% availability) and 16 out of 71 river gauges (77% availability) were marked 'out of action'. In line with standard practice, the data collected from some gauges was also marked as 'suspect' during the Flood Event, and therefore required close examination prior to being used in modelling. Details of all these stations are contained in Table 5.2.5 and Table 5.2.6.

Some gauges did not operate during the Flood Event as some sites were inundated with water, damaged by debris, impacted by lightning strikes or lost power. There were also some stations completely destroyed by the flood flows. By surveying the aftermath of the flood and its impacts along the river channels, it is easy to see how this occurred.

5 DATA COLLECTION SYSTEM PERFORMANCE

Rain ID	Site	Status date 19 Jan 2011	Comment
6633	Lyons Bridge AL-P	Out of action from 15:00 on 11 Jan 2011	Although this data was marked out of action in the system, it was also available for use through the BoM Environmon system.
6630	Lyons Bridge AL-B	Out of action from 09:00 on 11 Jan 2011	Although this data was marked out of action in the system, it was also available for use through the BoM Environmon system.
6568	O'Reillys Weir AL	Out of action from 19:34 on 11 Jan 2011	This site was severely damaged by flood water at the time indicated. This was late in the Event and rainfall after this time was minimal.
6641	Wivenhoe Dam TW AL-B	Out of action from 22:30 on 11 Jan 2011	This site was severely damaged by flood water at the time indicated. This was late in the Event and rainfall after this time was minimal. Manual readings are also available at this site.

Table 5.2.5 - Additional Rainfall gauges marked out of action or suspect during the Flood Event

River ID	Site	Status date 19 Jan 2011	Comment
6756	Burtons Bridge	Out of action from 08:00 on 12 Jan 2011	The adjacent stream height gauges at Savages Crossing and Mt Crosby Weir provide more useful information than this site during high flows.
6527	Helidon	Out of action from 14:40 on 8 Jan 2011	The downstream stream height gauge at Glenore Grove was used as a substitute for this data.
6578	Gatton	Out of action from 17:31 on 10 Jan 2011	The downstream stream height gauge at Glenore Grove was used as a substitute for this data.
6757	Kholo Bridge	Out of action from 15:20 on 11 Jan 2011	The adjacent stream height gauges at Savages Crossing and Mt Crosby Weir provide more useful information than this site during high flows.
6737	Kuss Road	Out of action from 15:22 on 8 Jan 2011	This site is located in the Bremer River catchment and the data is of limited value in gate operations decision making.
6647	Lowood AL-B	Out of action from 07:30 on 14 Jan 2011	The adjacent stream height gauge at Savages Crossing provides more useful information than this site during high flows.
6758	Mt Crosby AL-B	Out of action from 16:30 on 10 Jan 2011	This is a redundant gauge. Another river height gauge is available at this site.
6569	O'Reillys Weir	Out of action from 07:30 on 11 Jan 2011	This station is impacted by backwater from Wivenhoe Dam releases. This cannot be avoided. Data from adjacent stations at Lyons Bridge and Savages Crossing was used as a substitute for this data.
6591	Somerset Dam HW AL-B	Suspect from the time manual gauge readings commenced	This is a redundant gauge. Another dam height gauge is available at this site and manual readings are also available. Only a slight difference was noted between this gauge and the manual observations.
6637	Wivenhoe Dam HW AL-A	Out of action from 10:00 on 11 Jan 2011	This is a redundant gauge and manual readings are available at this site.

5 DATA COLLECTION SYSTEM PERFORMANCE

River ID	Site	Status date 19 Jan 2011	Comment
6638	Wivenhoe Dam HW AL-B	Out of action from 11:00 on 10 Jan 2011	This is a redundant gauge and manual readings are available at this site.

Table 5.2.6 – Additional Water Level gauges marked out of action or suspect during the Flood Event

For the duration of the Flood Event, just over 130,000 individual observations, 32,000 rainfall and nearly 100,000 water level readings were received from the ALERT network in the Flood Operations Centre. This provides an indication of the system load that is required to be managed during the Event.

Table 5.2.7 below shows the number of readings received from each rainfall and water level gauge.

6 EVENT DATA

6.1 Introduction

A real time flood monitoring and forecasting system has been established to monitor rainfall and water levels in the Dam catchments and to provide adequate, accurate and timely information for informed decision-making. This system is described in detail in Section 5. Following is a description of the operational rainfall and river height data collected during the January 2011 Flood Event using this system, as well as a description of other supporting information used by the Flood Operations Centre to support decision-making during the Event.

It should be noted, the data contained in this Section is operational data which was collected during the Event and upon which operational decisions were made. The data is considered accurate, however only real time validation of the data has been undertaken. Given the time constraints for preparation of this Report, it is recognised that more information may become available over time to add to the Event data presented in this Section.

6.2 Forecast rainfall

Forecast rainfall tools provided by the Bureau of Meteorology (BoM) that were examined and considered in decision making during the January 2011 Flood Event were:

- 24 hour Quantitative Precipitation Forecasts (QPF) for the Dam catchments.
- The BoM weather radar (available through www.bom.gov.au)
- BoM SILO meteograms forecast rainfall (based on BoM ACCESS Model);
- BoM interactive weather and wave forecast rainfall maps (based on BoM ACCESS Model);
- BoM water and the land forecast rainfall (based on an ensemble of several numerical weather prediction models);
- BoM severe weather warnings.

Of these, QPF are considered the primary forecast tool as they are provided by BoM to give specific forecast information in relation to the Dam catchment areas. The QPF leading up to and during the Event are shown in Table 6.2.1 following. In relation to the data shown in this table, the following observations can be made;

- The QPF provided a reasonable representation of the actual daily rainfall recorded until 16:00 Saturday 8 January 2011. The 11 forecasts issued to 16:00 Saturday 8 January 2011, overestimated rainfall during this period by only 21%. This is considered an excellent result. However, the total catchment average rainfall recorded during this five day period was only in the order of 100mm.
- In the five forecasts issued between 16:00 Saturday 8 January 2011 and 10:00 Tuesday 11 January 2011, the QPF underestimates daily actual catchment average rainfall by between 160% to 340%, with an average error of 225%. This was the critical rainfall period, with the catchment average rainfall recorded during this two-and-a-half day period being in the order of 300mm.
- For the two forecasts issued during the period between 10:00 Tuesday 11 January 2011 and 16:00 on Tuesday 11 January 2011, the QPF overestimates daily actual catchment average rainfall by between 196% to 625%, with an average error of 270%. The total catchment average rainfall recorded during this period was only in the order of 45mm.
- The QPF provided a reasonable representation of the actual rainfall recorded after 10:00 on Wednesday 13 January 2011.

Table 6.2.1 – Actual and forecast rainfall comparison (BoM QPF)

As well as examining and modeling the QPFs, the ACCESS model result data provided by BoM allows three day and five day rainfall forecasts to be examined and considered in flood event decision making.

A summary of this data is shown in the following table that contains translated rainfall forecasting results using ACCESS model result data provided by BoM during the critical period of the Event (between 6 and 11 January 2011). The original BoM data has been translated to forecast catchment average rainfall results, based on a derived catchment centroid rainfall, estimated by using Seqwater's Flood Early Warning Modelling System.

Table 6.2.2 Actual and forecast rainfall comparison (BoM ACCESS model)

Deleted: 1

Table 6.2.2 above shows:

- There are variations in excess of 700% between successive three-day catchment average rainfall forecasts made 12 hours apart;
- There are variations in excess of 700% between successive five-day catchment average rainfall forecasts made 12 hours apart;
- There are eight instances in which actual rainfall recorded is greater than 200% (highest is more than 1,000%) of the three-day forecast rainfall;
- There are three instances in which the three-day forecast rainfall is greater than 150% (highest is 280%) of the actual rainfall recorded;
- There are nine instances in which actual rainfall recorded is greater than 300% (highest is over 1,000%) of the five-day forecast rainfall;
- There are two instances in which the five-day forecast actual rainfall is greater than 200% (highest is 280%) of the actual rainfall recorded.

These results show that three day and five day forecasts only provide an indication of future rainfall and these forecasts cannot be used as a basis of flood operations decision making where public safety in both rural and urban areas is directly impacted. This forecasting information uses the most up-to-date technology available within BoM at the present time. Future improvements in this area will be examined with interest in order to maximise the flood mitigation benefits of the Dams.

6 EVENT DATA

6.3 Event rainfall totals

As discussed in Section 5, Seqwater uses a network automated rainfall stations within the Brisbane River catchment area to gather rainfall data during flood events. Data from this network is automatically collected in real time using a radio telemetry collection system and sent in real time to the Flood Operations Centre. Every millimetre of rainfall recorded at each station is sent immediately to the Flood Operations Centre as it is recorded.

Data sent to the Flood Operations Centre in this way is operational data that has not been validated. Both manual and automatic data checking was undertaken in the Flood Operations Centre at regular and routine intervals over the course of the Event.

Table 6.3.1 shows the daily rainfall totals collected by the Flood Operations Centre (both Flood-Col and Envromon) at each of the rainfall stations during the Event. Stations highlighted in **bold** are configured in the flood models and used in modelling of flows.

Table 6.3.1 - Daily rainfall totals by station for the duration of the January 2011 Flood Event

6 EVENT DATA

The following maps (Figure 6.3.2 to Figure 6.3.11) illustrate the data in Table 6.3.1.

Rainfall in the 24 hours to 09:00 on Wednesday 5 January 2011

In the 24 hours to 09:00 on Wednesday 5 January 2011, only small rainfall totals, generally less than 5mm, were recorded in the Brisbane Basin. The word "None" on the map signifies that no reports were received from the station during the period. Figures in red also indicate errors in the data.

6 EVENT DATA

Rainfall in the 24 hours to 09:00 on Friday 7 January 2011

Compared to the previous period, rainfall generally eased in the 24 hours to 09:00 on Friday 7 January. Rainfall in the period was again wide-spread, however totals were generally between 10mm to 30mm, with an occasional isolated higher total in the Upper Brisbane River and Stanley River catchments.

Deleted: upper

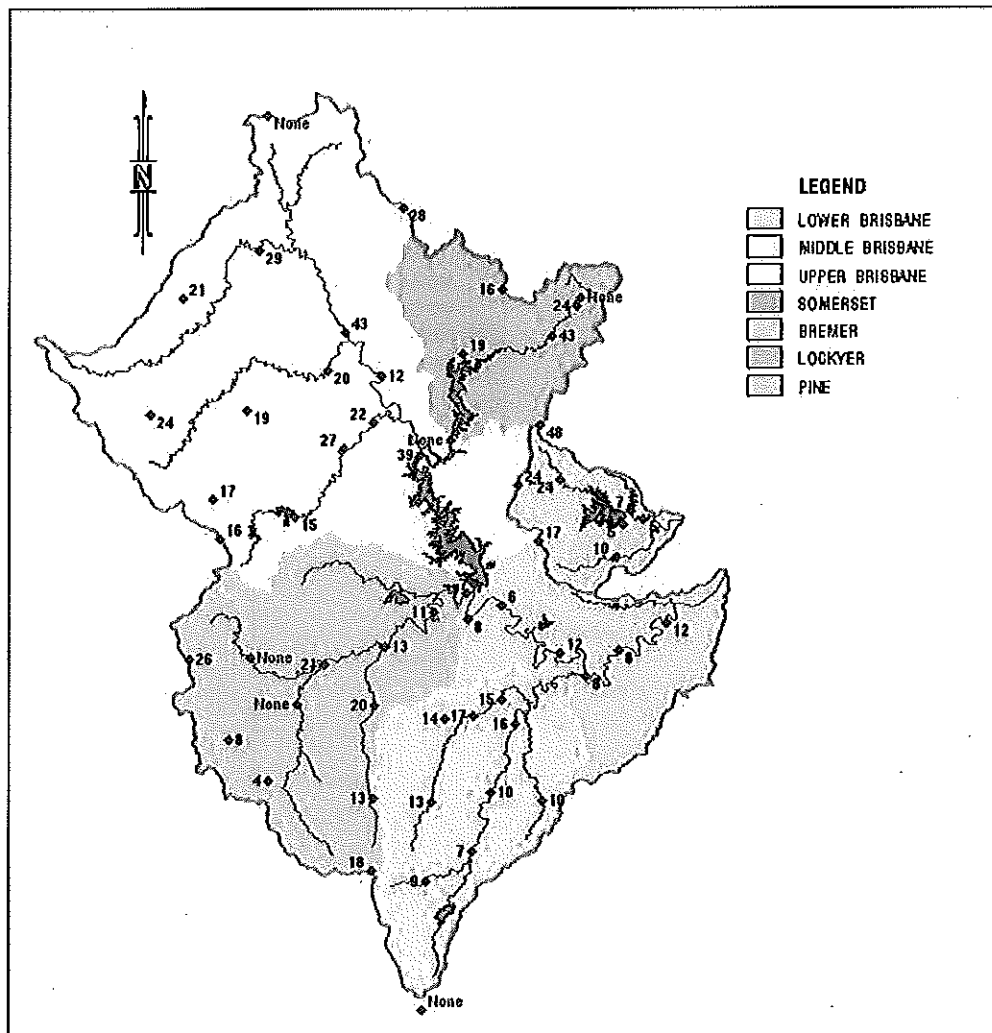

Figure 6.3.4 - Rainfall in the 24 hours to 09:00, Friday 7 January 2011

DRAFT

6 EVENT DATA

Rainfall in the 24 hours to 09:00 on Tuesday 11 January 2011

Heavy rain continued to be recorded throughout the Brisbane Basin in the 24 hours to 09:00 on Tuesday 11 January 2011, with the highest totals in the area around the Lower Middle Brisbane River and upper reaches of the Lower Brisbane River catchment, with totals up to 262mm at Mt Glorious. In the Stanley River catchment, totals between 80mm and 130mm were again reported widely throughout the catchment.

Deleted: lower
Deleted: middle
Deleted: lower

Particularly heavy rainfall was recorded in the upper reaches of Lockyer Creek around Toowoomba, which recorded 116mm in the period, with most of this falling the previous afternoon. Very large totals were also recorded in the headwater area of Laidley Creek, where nearly 200mm was reported at Mount Castle. In the Bremer River catchment, rainfall was still widespread, although totals were generally below 70mm.

Totals in the Lower Brisbane River area were generally below 30mm, although there were very high totals around Fernvale.

Deleted: lower

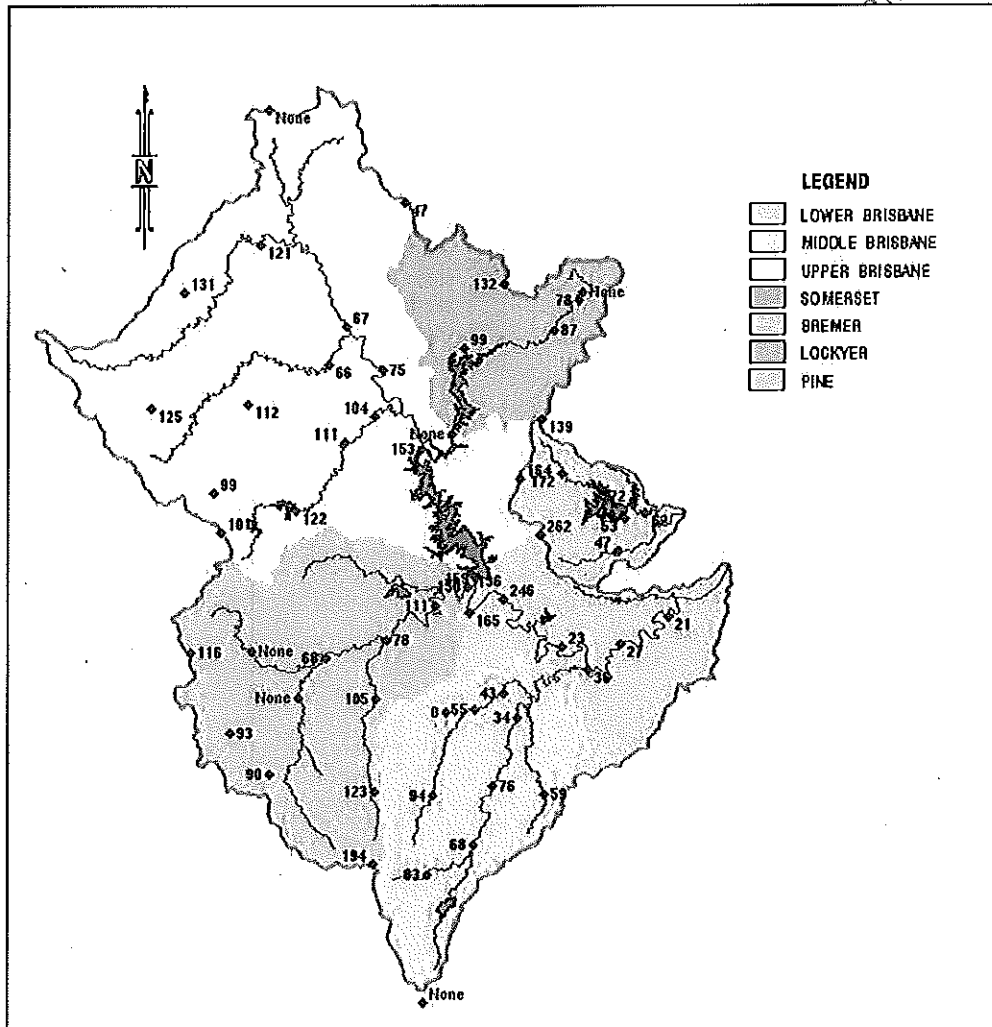

Figure 6.3.8 - Rainfall in the 24 hours to 09:00, Tuesday 11 January 2011

6 EVENT DATA

Rainfall in the 24 hours to 09:00 on Wednesday 12 January 2011

High rainfall continued to be recorded in the upper reaches of the Stanley River, with falls in excess of 220mm in the 24 hours to 09:00 on Thursday 12 January 2011.

In the Upper Brisbane River catchment, rainfall had eased with 24-hour totals generally less than 30mm. However, heavy rainfall continued in the area around Wivenhoe Dam and just south, with totals between 150mm and 230mm in the area, most of which fell in the previous afternoon.

Deleted: upper

Heavy rain continued in the Laidley Creek, Bremer River and Warrill Creek catchments, with totals up to 120mm.

Elsewhere in the Lower Brisbane River catchment, totals ranged from 40mm to 70mm.

Deleted: lower

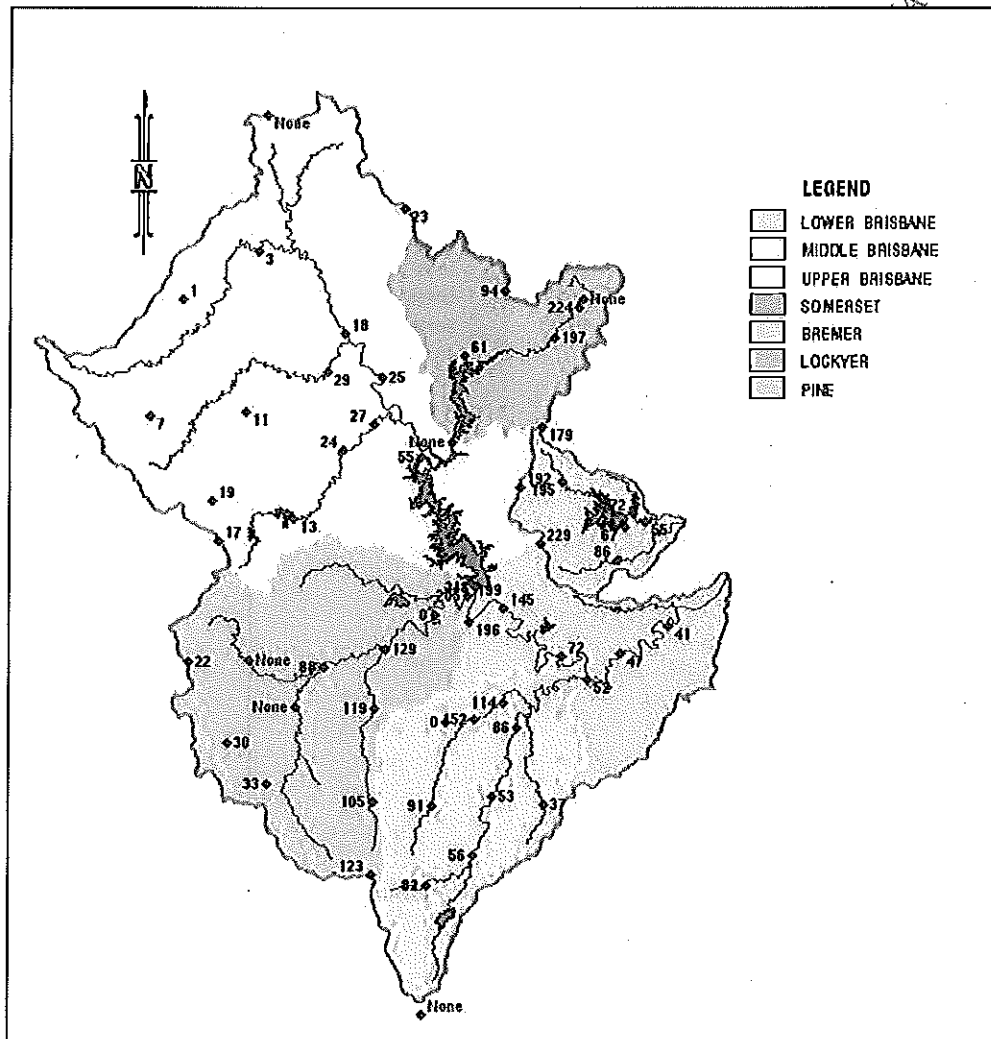

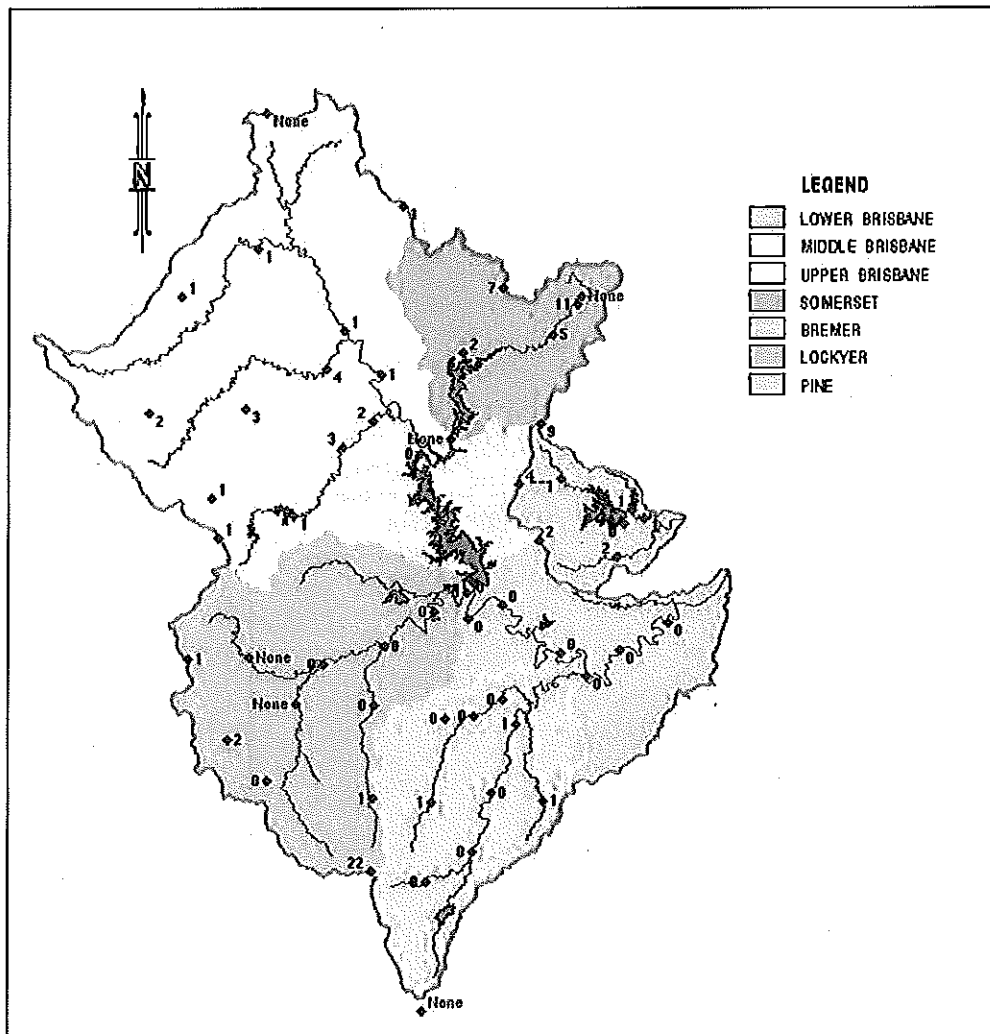

Figure 6.3.9 – Rainfall in the 24 hours to 09:00, Wednesday 12 January 2011

6 EVENT DATA

Rainfall in the 24 hours to 09:00 on Thursday 13 January 2011

By 09:00 on Thursday 13 January 2011, the rainfall event was virtually complete, with totals generally below 10mm in the 24-hour period, with only an isolated higher total of 22mm at Mount Castle in Upper Laidley Creek.

Deleted: upper

DRAFT

Figure 6.3.10 - Rainfall in the 24 hours to 09:00, Thursday 13 January 2011

6 EVENT DATA

Rainfall in the six days to 09:00 on Thursday 13 January 2011

Figure 6.2.11 below shows the rainfall distribution during the six-day period to 09:00 on Thursday 13 January 2011.

The highest totals were recorded in the headwater ridges in the Stanley River catchment and along the D'Aguilar Range from Mt Mee to Mt Glorious. Elsewhere through the Stanley, Upper Brisbane River and Middle Brisbane River catchments, rainfall totals - while still significant - were half those recorded at elevated stations.

Deleted: upper

Deleted: middle

This effect was not as pronounced in the Lockyer Creek and Bremer River catchments, where the totals over the period tended to be more uniform. In the Lower Brisbane River area, totals in urban areas were half of those recorded around Fernvale and Lowood.

Deleted: lower

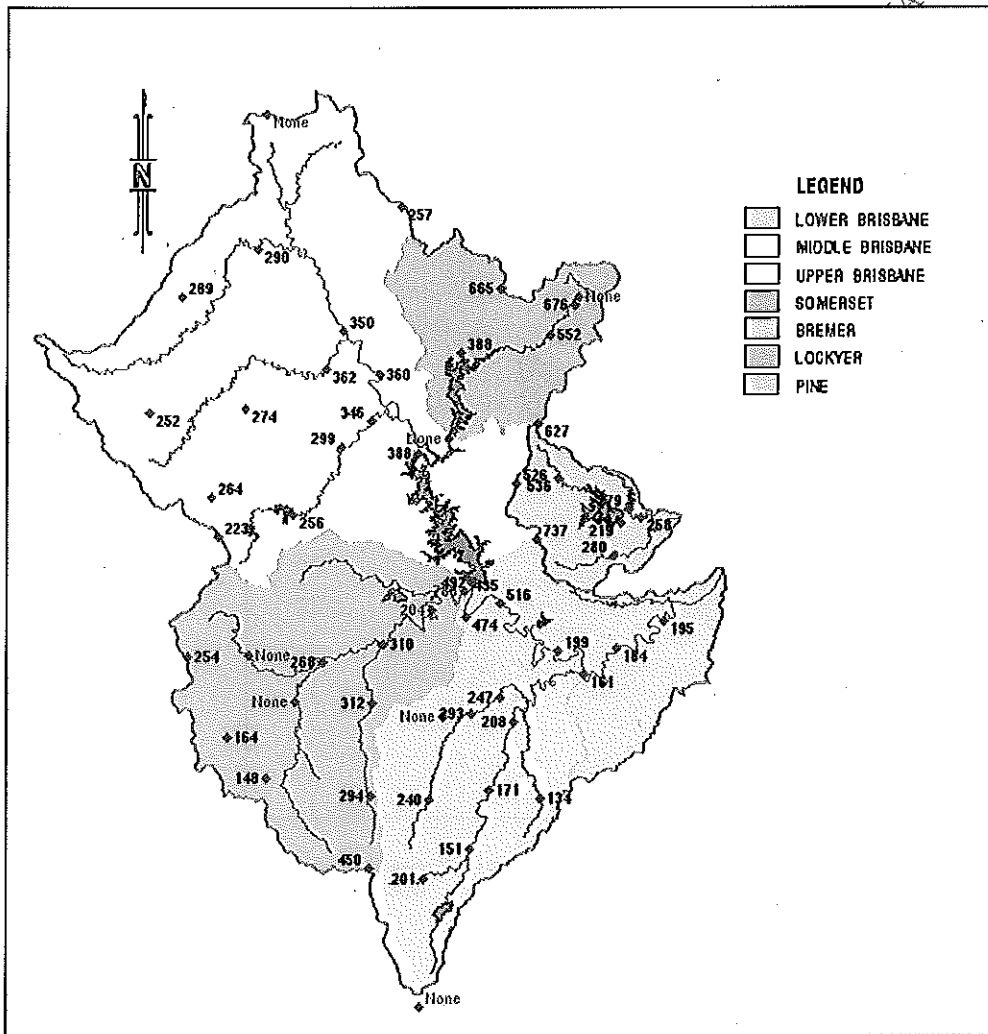

Figure 6.3.11 - Rainfall in the six days to 09.00, Thursday 13 January 2011

6 EVENT DATA

Over the nine-day period ending 09:00 on Thursday 13 January 2011, the highest rainfall total in any of the Seqwater operated gauges was 814 millimetres at the Mt Glorious gauge, just to the east of Wivenhoe Dam.

Individual highest daily (24 hours to 09:00 on the date indicated) rainfall includes:

- Bellthorpe West 106mm, Sunday 9 January 2011
- Bellthorpe West 310mm, Monday 10 January 2011
- Mt Glorious 262mm, Tuesday 11 January 2011
- Lyons Bridge 242mm, Wednesday 12 January 2011

Average rainfall for each subcatchment in the Brisbane Basin is determined by applying a weighting to the rainfall depth at each available station within the subcatchment. Within the operational system, the Brisbane Basin is divided into the two subcatchments shown in the table below.

The Somerset catchment represents the average catchment rainfall in the Stanley River to Somerset Dam.

The Upper Brisbane River catchment, as represented in Table 6.3.12, represents the total Wivenhoe Dam catchment, excluding the Somerset Dam catchment, and is a weighted average of the Upper and Middle Brisbane River catchments shown in Figure 6.3.13. For example, the weighted average of the Upper Brisbane River catchment (359mm) and Middle Brisbane River catchment (525mm) shown on the map gives a catchment average of 401mm for the Event.

Table 6.3.12 – Daily rainfall throughout the total Wivenhoe Dam catchment (excluding Somerset Dam catchment)

The following map (Figure 6.3.13) illustrates the data contained in Table 6.3.12, summarised over the period of the Event during which significant rainfall was recorded. Catchment rainfall in the eight days to 09:00 Thursday 13 January 2011.

- Deleted: on

6 EVENT DATA

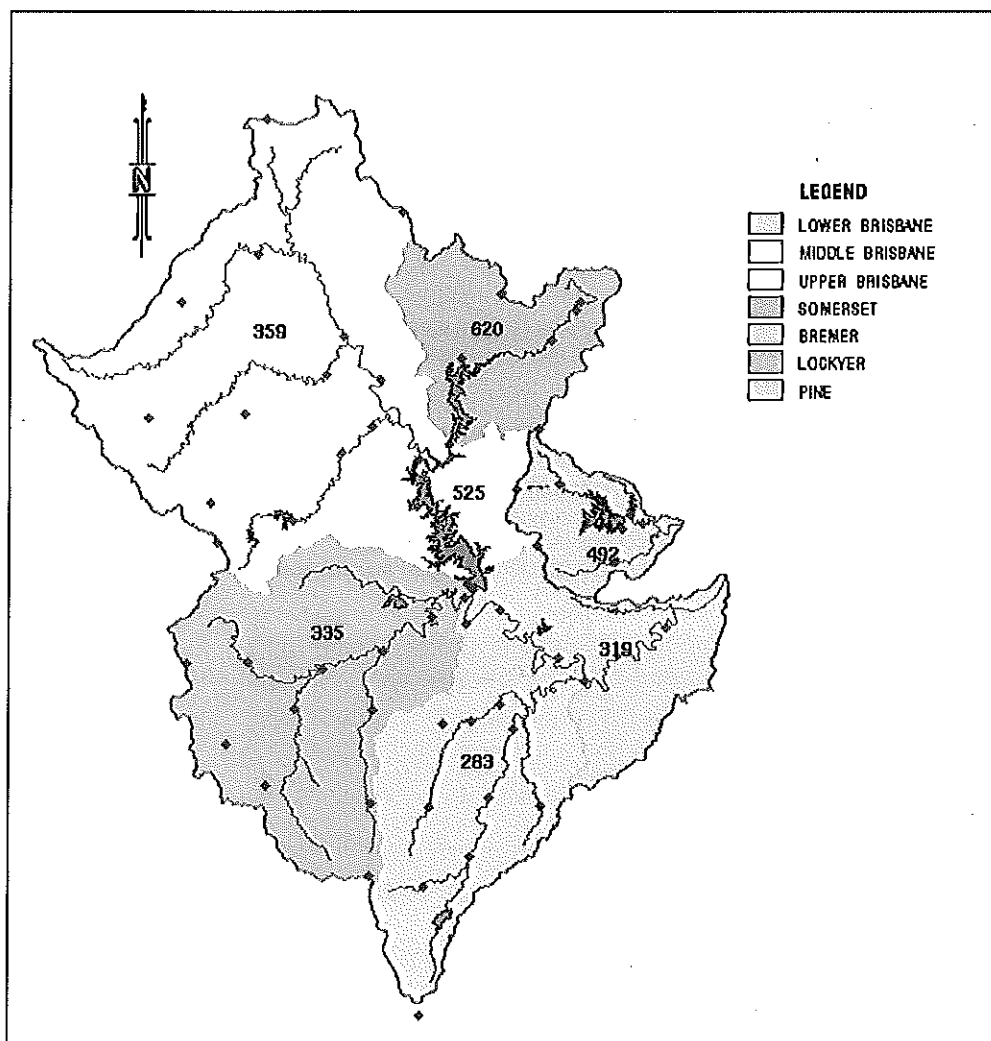

Figure 6.3.13 - Catchment rainfall in the eight days to 09:00, Thursday 13 January 2011

The following catchment average rainfall hyetographs (Figure 6.2.14 to Figure 6.2.19) do not necessarily reflect the localised high intensity rainfall recorded throughout the Basin at various times and locations.

Catchment rainfalls can include hourly intensities at individual stations which can be up to five times the catchment average.

6 EVENT DATA

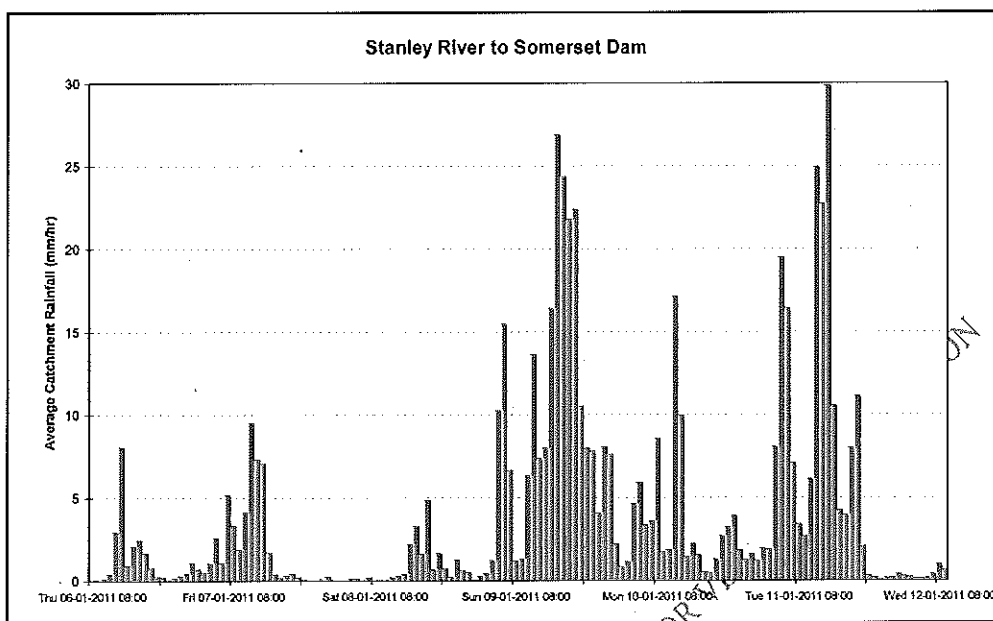

Figure 6.3.14 - Stanley River average hourly rainfalls

Figure 6.3.15 - Upper Brisbane River average hourly rainfalls

6 EVENT DATA

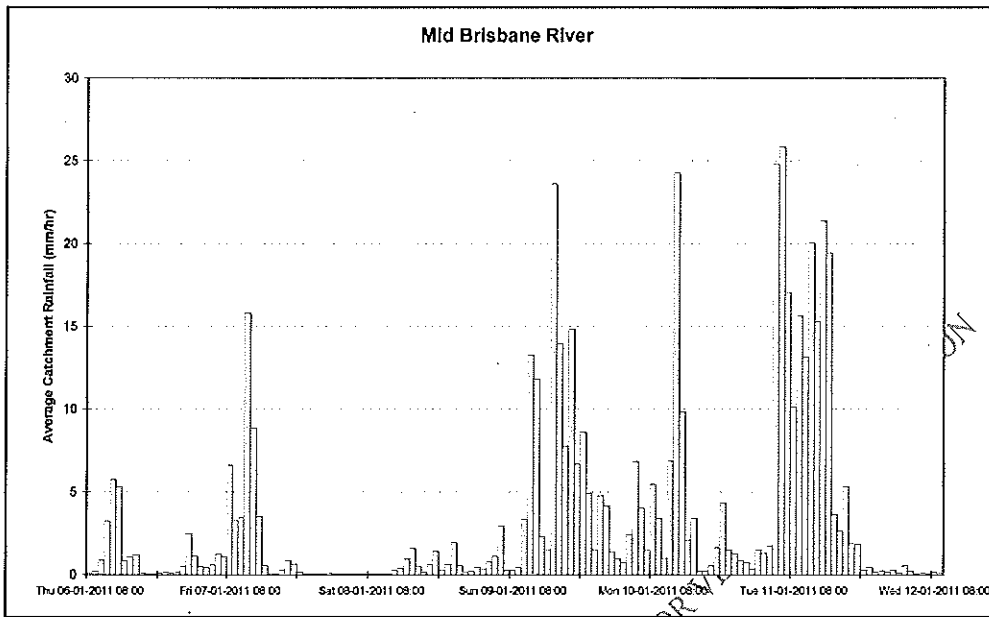

Figure 6.3.16 – Middle Brisbane River average hourly rainfalls

Figure 6.3.17 – Lockyer Creek average hourly rainfalls

6 EVENT DATA

Figure 6.3.18 – Bremer River average hourly rainfalls

Figure 6.3.19 – Lower Brisbane River average hourly rainfalls

The average catchment rainfall graphs clearly show a number of individual and linked rainfall bursts over the duration of the Event. The two most intense bursts occurred relatively late in the Event between the following periods:

- The morning and evening of Sunday 9 January 2011
- The early morning and afternoon of Tuesday 11 January 2011, interspersed with a period of lower rainfall.

6 EVENT DATA

An intense burst at the end of the Event, followed by a relatively sudden end to the rainfall, is characteristic of most of these temporal patterns. Tables of hourly rainfall for all stations used during the Event (demonstrating this pattern) are contained in Appendix O, with one table per day during the period Wednesday 5 January 2011 to Thursday 13 January 2011.

Significant hourly rainfall totals include:

Location	Time	Hourly rainfall (mm)	
Lindfield in the upper reaches of Sheepstation Creek	14:00, Sunday 9 January 2011	54	Deleted: on
Blackbut in the upper reaches of the Brisbane River	16:00, Sunday 9 January 2011	54	Deleted: on
Savages Crossing on the Brisbane River near Fernvale	09:00, Tuesday 11 January 2011	93	Deleted: on
Ferris Knob in the upper reaches of the Stanley River	11:00, Wednesday 12 January 2011	69	Deleted: on

Table O.3.20 – Significant hourly rainfall totals

6 EVENT DATA

6.4 Event rainfall temporal patterns

Temporal patterns are critical to the flood modelling process and the resulting inflow hydrographs. They define the distribution of the rainfall with time, and indicate the distinct periods of heavy rainfall that occurred throughout the Brisbane Basin. Temporal patterns for selected representative stations are contained in Appendix T. The following conclusions can be drawn from examining this data:

- For this Event, the West Bellthorpe gauge represents the temporal pattern of the Somerset Dam catchment.
- For this Event, the Gregors Creek gauge represents the temporal pattern of the catchment area in the upper reaches of the Brisbane River.
- The period of heaviest rainfall recorded in both the West Bellthorpe gauge and the Gregors Creek gauge occurred on the afternoon and evening of Sunday 9 January 2011.
- At Toowoomba, near the headwaters of Lockyer Creek, high intensity rainfall occurred on the afternoon of Monday 10 January 2011 and resulted in flash flooding. This rainfall was not closely reflected in the catchment average rainfall patterns.
- Around the time the floodwaters (resulting from the first period of heavy rainfall) arrived at Wivenhoe Dam from the upper reaches of the Brisbane River, the next critical period of heavy rainfall occurred on the morning of Tuesday 11 January 2011 in the area immediately around the Wivenhoe Dam reservoir. This huge burst of inflow into the Dam required immediate action to avoid a situation that would risk the safety of the Dam.
- Hourly rainfall totals during the critical period of heavy rainfall, on the morning of Tuesday 11 January 2011 in the area immediately around Wivenhoe Dam, are summarised in Table 6.4.1. The table shows heavy rainfall commenced about 05:00 and continued until 14:00. This is believed to have contributed to the very high level inflows into Wivenhoe Dam during this period.

6 EVENT DATA

6.5 Event water levels

Seqwater uses a network of 34 automated stream height stations within the Brisbane River catchment area to gather Dam level and stream height data during flood events. Data from this network is automatically collected in real time using a radio telemetry collection system and is sent in real time to the Flood Operations Centre. Every recorded change in water level at each station is also sent directly to the Flood Operations Centre as it is recorded.

Data sent to the Flood Operations Centre in this way is operational data and is not validated. Both manual and automatic data checking is undertaken in the Flood Operations Centre at regular and routine intervals over the course of the Event.

While the vast majority of the water level data contained in this Report was collected automatically via the Seqwater ALERT network, manual observations of gauge boards at Somerset and Wivenhoe Dams were also collected via email and phone during the Event. These gauge board observations are more reliable than the automatically provided readings and, therefore, provided the basis for gate operations at the Dams.

Table 6.5.1 includes details of the peak heights recorded by the automatic gauging stations used during the Event. Multiple peaks were recorded at a number of stations through the period and are shown in the table in descending order. The table is based on data received in the Flood Operations Centre during the Event and has not been verified by field survey. The figures identified in *italics* are the maximum heights recorded prior to failure of the gauge.

Table 6.5.1 – Peak heights recorded at automatic gauging stations during the January 2011 Flood Event

Height hydrographs (Figure 6.5.2 to Figure 6.5.12) for selected key stations within the Brisbane River Basin are plotted below. During the Event, Flood Officers were responsible for basic data checking. A full set of the heights recorded at each flood monitoring station is contained in Appendix Q.

Formatted: Font color: Red

6 EVENT DATA

Stanley River at Woodford

The Stanley River at Woodford is a key gauging station upstream of Somerset Dam, however it only represents around 20% of the catchment to the Dam. This gauge operated reliably and provided sufficiently accurate operational data for modelling purposes during the Event.

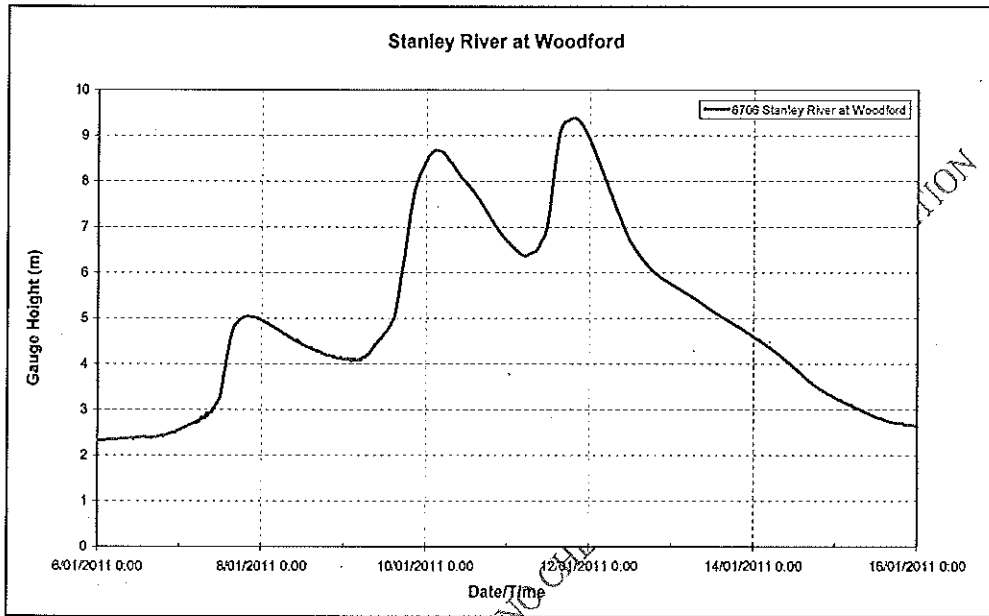

Figure 6.5.2 – Gauge height, Stanley River at Woodford

6 EVENT DATA

Somerset Dam

There are two automatic gauges at Somerset Dam, which provided readings slightly under the manual gauge board readings. As discussed previously, Dam operations were based on the data provided by gauge board readings.

Figure 6.5.3 - Gauge height, Somerset Dam

6 EVENT DATA

Brisbane River at Gregors Creek

The Brisbane River at Gregors Creek is the key gauging station upstream of Wivenhoe Dam. When combined with the outflow from Somerset Dam, this gauge represents almost 75% of the catchment to the Dam. This gauge operated reliably and provided sufficiently accurate operational data for modelling purposes during the Event.

Figure 6.5.4 - Gauge height, Brisbane River at Gregors Creek

6 EVENT DATA

Wivenhoe Dam

There are two automatic gauges at Wivenhoe Dam. Sensor 6638 was marked as 'out of action' (OOA) for the Event. The other sensor, located around 50m upstream of the gates, matched the manual gauge board readings until around midday on Tuesday 11 January 2011. It was at this point the large gate openings caused the local water level to lower in the vicinity of the gauge. This discrepancy, which was up to 0.8m at times, was observed during this period, however, as previously discussed, gate operations were, in fact, undertaken based on accurate manual gauge board observations. The discrepancy is shown clearly in Figure 6.5.6.

Deleted: 5

Figure 6.5.5 – Gauge height, Wivenhoe Dam

6 EVENT DATA

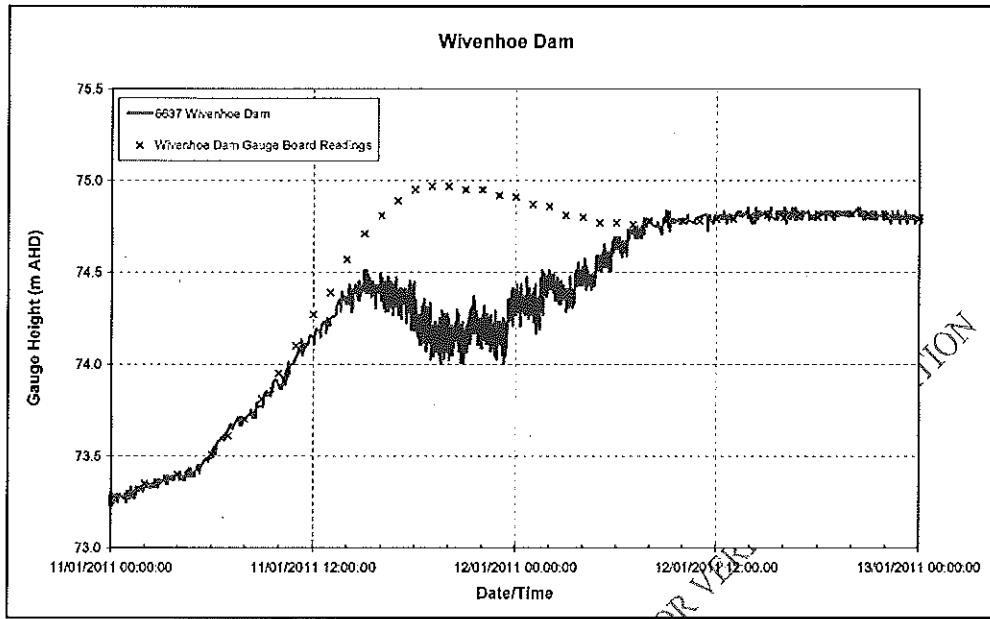

Figure 6.5.6 - Gauge height, Wivenhoe Dam

6 EVENT DATA

Lockyer Creek at Lyons Bridge

Lockyer Creek at Lyons Bridge is a key gauging station for determining outflows from Lockyer Creek into the Brisbane River. While the O'Reillys Weir gauge is located further down the catchment, it is influenced by backwater due to releases from Wivenhoe Dam. Therefore, readings from the O'Reillys Weir gauge during a large Event are not considered reliable. The Lyons Bridge gauge operated reliably and provided sufficiently accurate operational data for modelling purposes during the Event.

Figure 6.5.7 – Gauge height, Lockyer Creek at Lyons Bridge

6 EVENT DATA

Brisbane River at Savages Crossing

Savages Crossing is located just downstream from the junction of the Brisbane River and Lockyer Creek. This gauge is considered to more accurately represent the combined Lockyer and Brisbane flow than the upstream station at Lowood. This gauge operated reliably and provided sufficiently accurate operational data for modelling purposes during the Event.

Figure 6.5.8 - Gauge height, Brisbane River at Savages Crossing

6 EVENT DATA

Bremer River at Walloon

Walloon is a key gauging station used to determine total outflow from the Bremer River. It operated reliably and provided sufficiently accurate operational data for modelling purposes during the Event.

Figure 6.5.9 – Gauge height, Bremer River at Walloon

6 EVENT DATA

Warrill Creek at Amberley

Amberley is a key gauging station on Warrill Creek, and when combined with Walloon, it is a key gauging station used to determine total outflow from the Bremer River. This station operated reliably and provided sufficiently accurate operational data for modelling purposes during the Event.

Figure 6.5.10 – Gauge height, Warrill Creek at Amberley

6 EVENT DATA

Brisbane River at Moggill

Moggill is the key gauging station at the junction of the Brisbane and Bremer Rivers. It represents the combined flow of these two rivers. This gauge operated reliably and provided sufficiently accurate operational data for modelling purposes during the Event.

Figure 6.5.11 - Gauge height, Brisbane River at Moggill

6 EVENT DATA

Brisbane River at Whyte Island

The Brisbane River gauge at Whyte Island is located near to the mouth of the river and records tide levels. While tide levels do not directly impact dam operations, flood levels in the Lower Brisbane River are tide dependent and the Flood Operations Centre needs to be cognisant of the tides.

Deleted: lower

During the January 2011 Flood Event, recorded tides at Whyte Island were up to 0.5m lower than the previous week.

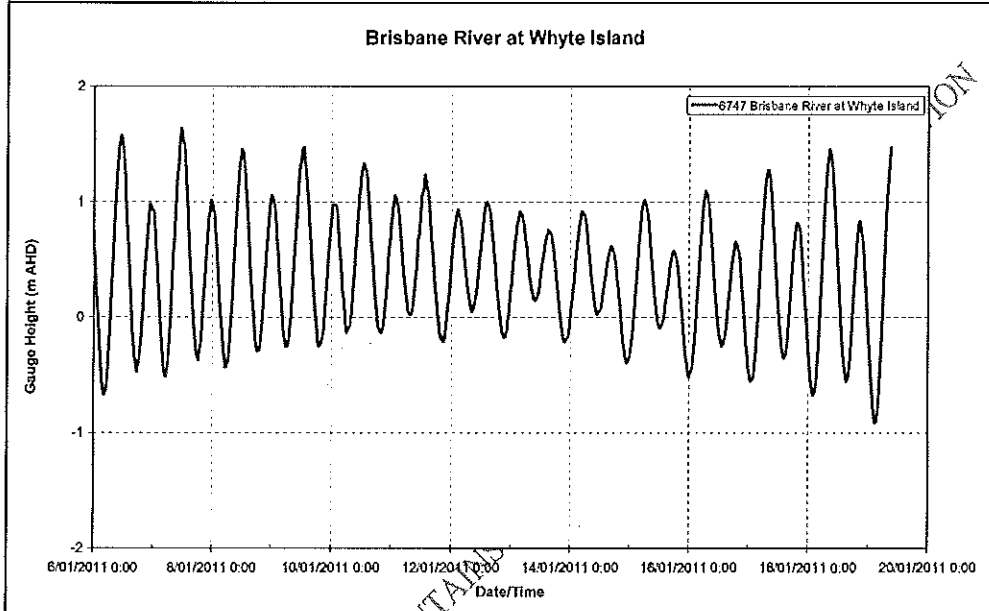

Figure 6.5.12 – Gauge height, Brisbane River at Whyte Island

6 EVENT DATA

6.6 Dam inflows and outflows

The inflows and outflows from Somerset and Wivenhoe Dams appear in Table 6.6.1 and are shown in more detail in Section 9 and Appendix B. Dam inflow is estimated by reverse routing. Reverse routing is calculating the rate of change of the storage and adding the Dam outflow.

Formatted: Font color: Red

Item	Unit	Somerset Dam	Wivenhoe Dam*
Inflow volume	ML	825,000	2,650,000
Outflow volume	ML	820,000	2,650,000
Inflow peaks	m3/s	5,350 on 09/01/2011 15:00 4,170 on 11/01/2011 14:00	10,100 on 10/01/2011 8:00 11,600 on 11/01/2011 13:00

Peak water level	m AHD	105.11 on 12/01/2011 06:00	74.97 on 11/01/2011 19:00

* Wivenhoe Dam inflow figures include Somerset Dam outflows

Table 6.6.1 - Summary inflows and outflows for Somerset and Wivenhoe Dams

The inflow into Somerset Dam is characterised by dual peaks; the first peak on the afternoon of Sunday 9 January 2011 being higher than the second on the afternoon of Tuesday 11 January 2011 (nearly 48 hours apart). The peak of the outflow occurred late on Monday 10 January 2011 when five sluices were opened. These were quickly closed on the morning of Tuesday 11 January 2011 when Wivenhoe Dam levels began rising quickly. The maximum water level in Somerset Dam of 105.11m was reached on the morning of Wednesday 12 January 2011. This information is summarised in the following graph, Figure 6.6.2.

Figure 6.6.2 - Somerset Dam water levels, January 2011 Flood Event

Similar to Somerset Dam, the inflow into Wivenhoe Dam is also characterised by dual peaks. The first peak on the morning of Monday 10 January 2011 was lower than the second on the afternoon of Tuesday 11 January 2011 (30 hours apart). The peak of the outflow occurred at 19:00 on Tuesday 11 January 2011. Flow was

6 EVENT DATA

reduced quickly later that night as the Dam water level stabilised, however it was increased again during Thursday 13 January 2011 to achieve the drainage required within seven days after the flood peak passed below Moggill. The peak water level in Wivenhoe Dam of 74.97m was reached at 19:00 on Tuesday 11 January 2011. This information is summarised in the following graph, Figure 6.6.3.

Figure 6.6.3 – Wivenhoe Dam water levels, January 2011 Flood Event

DRAFT ONLY - THIS DOCUMENT CONTAINS NO

6 EVENT DATA

6.7 Other data sources

Other decision-making support tools examined and considered in conjunction with the modelling results include:

Formatted: Font color: Auto

- Flood model results (available via BoM registered user service);
- Enviromon, the BoM replacement software for Flood-Col. This includes all available ALERT stations in South East Queensland, including a large number of non-Seqwater stations.

During the Event, detailed discussions were also held with the BoM Flood Warning Centre. These discussions centred on model results, rainfall forecast information and actual and projected Dam inflows and outflows. BoM also provided Lockyer Creek and Bremer River outflows to compare against modelled results generated by the Flood Operations Centre. Generally, Flood Operations Centre modelling correlated well with BoM modelling results.

Similar discussions were held with Brisbane City Council and the Council also provided stage damage data for consideration by the Flood Operations Centre during the Event.

In addition to the sources listed above, for comparison purposes, the DERM website (www.derm.qld.gov.au) was used to examine and check river height and flow estimations at selected gauging stations.

7 FLOOD MODEL VALIDITY AND PERFORMANCE

7.1 Background

A real time flood monitoring and forecasting system has been established to monitor rainfall and water levels in the Dam catchments and to provide adequate, accurate and timely information for informed decision making. This system is described in detail in Section 5. As the real time rainfall and river height data is received in the Flood Operations Centre, the data is processed using a Real Time Flood Model (RTFM) to estimate likely Dam inflows and evaluate a range of possible inflow scenarios based on forecast and recorded rainfall in the Dam catchments.

Deleted:
Deleted: Once
Deleted: d

The RTFM comprises a suite of hydrologic computer programs that use real time data to assist in the operation of the Dams during flood events. Seqwater is responsible for providing and maintaining the RTFM and for ensuring sufficient data is available to allow its proper operation during a flood event. Flood Operations Engineers use the RTFM for flood monitoring and forecasting during flood events to operate the Dams in accordance with the Manual. This is done by optimising releases of water from the Dams to minimise the impacts of flooding in accordance with the Manual's objectives and procedures.

Seqwater is continually improving the operation of the RTFM by:

Deleted: over time

- Implementing improvements based on flood event audits and reviews;
- Improving RTFM calibration as further data becomes available;
- Updating software in line with modern day standards;
- Improving the coverage and reliability of the data collection network to optimise data availability during flood events.

Deleted: E

This Section describes the RTFM in detail and assesses the performance of the RTFM during the January 2011 Flood Event.

7.2 Model description

The current RTFM was developed in 1994 as part of the Brisbane River and Pine River Flood Study, (DNR, 1994) and consists of two integrated modules:

- FLOOD-Col;
- FLOOD-Ops.

FLOOD-Col is the data capture module whilst FLOOD-Ops is the data analysis module. The system is accessed through a Graphical User Interface (GUI) that allows the operator flexibility in managing the system. The modelling system was developed under a UNIX operating environment using OSF/Motif GFUI under the X Window system. In 2008, the system was ported to a LINUX operating environment and is currently running on a DELL PowerEdge 1800 Server. The RTFM performs the tasks outlined below.

Comment [MSOffice1]: CHE CK this is correct

- Automatically and continuously collects, filters and stores rainfall and water level data in real time.
- Assigns temporal and spatial distributions of actual and forecast rainfall for extension into the future;
- Evaluates the spatial and temporal distribution of antecedent catchment soil moisture conditions on a daily basis;
- Performs hydrologic routing of stream flows in an integrated environment;
- Provides estimates of storage performance and resulting downstream releases;
- Prepares summary output in textual and graphical format for storage operation and resulting downstream flood levels and flows.

As described in Section 5, the primary source of raw data for the RTFM are the rainfall and water level gauges located within and around the Dam catchments. Data collection is completely independent to data analysis

7 FLOOD MODEL VALIDITY AND PERFORMANCE

within the RTFM system. Filtered data obtained from the gauges can be viewed in a textual or graphical format. Facilities for viewing groups of gauges are also available. The types of information that can be viewed or edited include height, discharge, rainfall pluviographs, rainfall hyetographs, lake levels and dam volumes.

The data analysis system and modelling within the RTFM has been developed around the concepts of Regions, Processes and Cases. These are each explained individually below.

Regions

Regions are land areas located above a stream gauging station, which can be assigned Processes depending upon the nature of the Region. For example, a sub-catchment Region is assigned a soil moisture accounting Process and a runoff-routing Process, whereas a reservoir Region is assigned only a reservoir routing Process. A Region's relationships with neighbouring Regions are defined for each Process associated with the Region. Generally, outflow from one Region is inflow into its adjoining downstream Region.

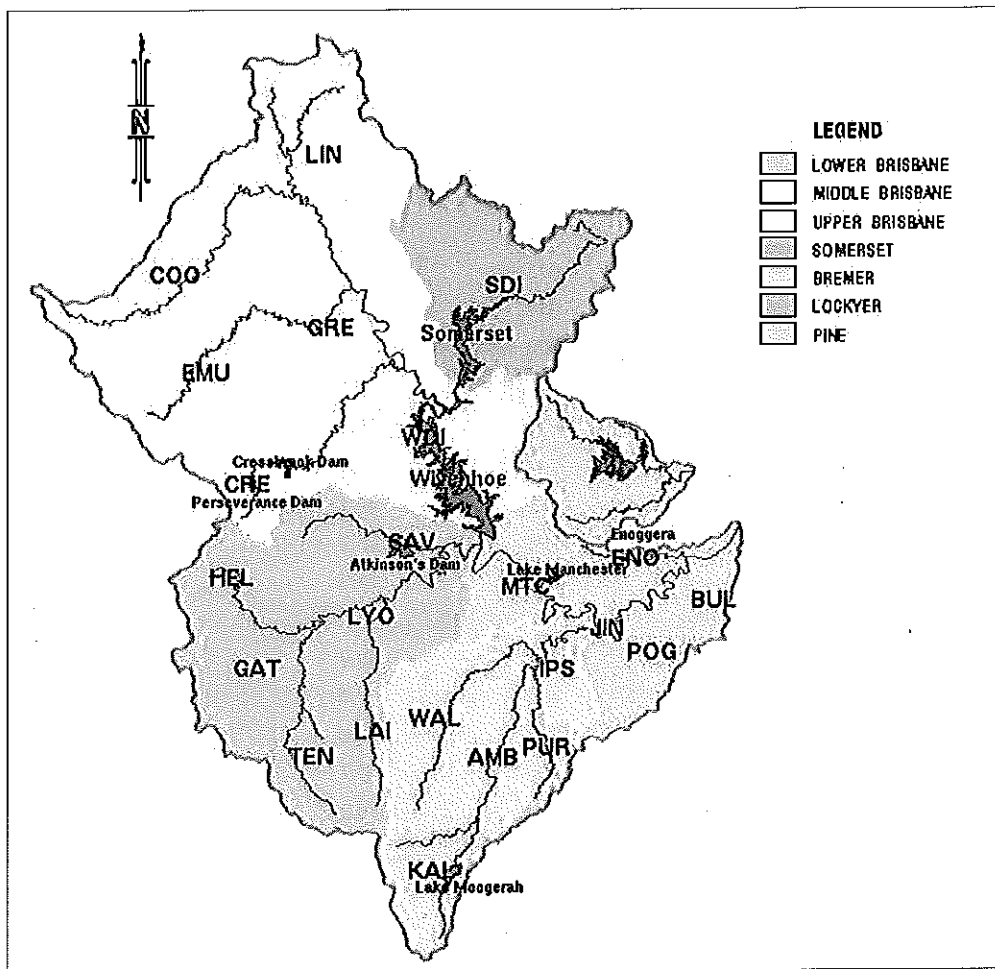

The Region database contains the following information;

- Extent and location of sub-areas within Regions and Regions within catchments;
- Connectivity of sub-areas within Regions and Regions with catchments;
- The list of Processes associated with each Region;
- Process module input definitions.

Figure 7.2.1 shows the Region layout adopted in the RTFM system.

7 FLOOD MODEL VALIDITY AND PERFORMANCE

Processes

A Process is a computational model of a physical mechanism. The Processes contained in the RTFM are soil moisture accounting, runoff-routing, reservoir routing and base flow. These Processes are explained in detail below:

- **Soil Moisture Accounting**

Soil Moisture Accounting is used to provide an indication of catchment saturation at the commencement of a flood event. Relationships have been derived which relate conceptual soil moisture storage volumes with rainfall loss rates. The RTFM contains a number of different process models that perform similar functions. For example the Soil Moisture Accounting Module consists of several different model types, which are as follows:

- Antecedent Precipitation Index (API);
- Residual Baseflow Index;
- SACRAMENTO Model.

These models are described in detail in the Brisbane River and Pine River Flood Study Report Series, (DNR, 1994), Report on Regional Loss Model Relationships, June 1994.

During the January 2011 Flood Event, the API model was used to derive initial estimates of rainfall loss rates during the early period of the Event. These initial estimates were updated as initial stream rises were detected. This enabled the event loss rates to be closely estimated by matching model results with the actual data received from the water level gauges in the Dam catchments. Relationships derived by the Bureau of Meteorology that link API and initial loss rate were utilised during the Event. These equations are of the following form:-

Initial Loss (Summer Period)

- $IL = 62.5 - 0.4386 * API$

Where:

- IL = Initial Loss (mm)
- API = Antecedent Precipitation Index based upon 30 day rainfalls (mm)
- Minimum API = 5mm
- Maximum API = 150mm

Deleted:
Deleted:

- **Runoff-routing**

Runoff-routing is used to estimate the surface runoff from rainfall within a Region. This Process uses concentrated storages distributed over a Region, which have a non-linear storage-discharge relationship. This Process originated as WT42 but was rewritten in ANSI C for the inclusion into the RTFM. This enabled the system to use improved data structures to access data more efficiently in real time. The Process was also modified to operate in a manner that allowed separate Regions to be run as a series of linked cascading models. This allows for more effective use of spatially varying data.

The runoff-routing Process was calibrated using ten historical flood events (up to 1994) and has been used to successfully simulate operational floods in February 1999, March 1999, February 2001, February 2010, March 2010 and October 2010. Table 7.2.3 below shows the region runoff-routing parameters that are used in the RTFM.

Table 7.2.3 – Region runoff-routing parameters

• Reservoir routing

Reservoir routing is used to estimate the outflow from a reservoir within a Region. This Process is incorporated into the RTFM based on level pool routing algorithms. The development of this Process to account for Somerset Dam and Wivenhoe Dam was complex as it needed to fully account for the rules used to operate these dams during flood events including the requirement for conjunctive operation to allow the flood mitigation benefits of the Dams to be maximised.

The Process originally incorporated into the RTFM is an adaptation of a stand alone computer program known as WIVOPS that incorporates the flood operation objectives described in the October 2004, Version 6 of the 'Manual of Operational Procedures for Flood Mitigation for Wivenhoe Dam and Somerset Dam'. WIVOPS was further modified in May 2005 to incorporate the Stage 1 auxiliary spillway works as defined in

7 FLOOD MODEL VALIDITY AND PERFORMANCE

the Wivenhoe Dam Alliance Report entitled, 'Design Discharges and Downstream Impacts of Wivenhoe Dam Upgrade', Report Number Q1091, June 2004.

The current operational Process used in the RTFM for reservoir routing uses Dam inflow estimates and catchment stream extracted from the FLOOD-Ops and imports this data into customised gate operation spreadsheets for use in determining appropriate gate operation strategies in accordance with the Manual. This system has been proven to work very effectively.

- **Base-flow**

Base flow is used to estimate residual stream flow that is additional to surface run-off. FLOOD-Ops only estimates surface runoff which is generally the major component of the total runoff and accurate assessment of the total runoff is required to accurately model rises in dam storage levels. The base flow component was introduced to assist in determining more accurately the total inflow volumes into the dams.

The base flow model (after Boughton) has the form:

- $\text{Base Flow}_t = ((\text{Base Flow}_{t-1} \times \text{BR}) + (\text{BC} \times Q_t)^{\text{BM}})$

Where:

- Base Flow_t = Baseflow at time t (m3/s)
- BR = Base Flow Recession Constant (~0.975 or less than unity)
- Q_t = Modelled Surface Runoff at time t (m3/s)
- BC = Surface Runoff Factor (~0.002)
- BM = Exponent (~1.0)

Formatted: Subscript

As stated above, FLOOD-Ops only estimates surface runoff and does not calculate base flow as this is added in the gate operations spreadsheets. This should be noted when comparing output data from FLOOD-Ops to the final estimated dam inflow volumes. Base flow coefficients can be adjusted during flood events to allow matching of model results with actual data.

At the start of the January 2011 Flood Event, a residual base flow into the Dams resulting from the post Christmas flood was evident. As a result, the starting base flow used in the RTFM was relatively high and was adjusted to match the water level rises in the dams in the absence of surface runoff. As surface runoff increased during the event, the base flow component of the total runoff hydrograph decreased and by the end of the event was between 8% and 10% of the total inflow volume into the Dams. Final event estimates of base flow in volumetric terms, for the two dams were, 114,000 ML for Somerset Dam and 250,000 ML for Wivenhoe Dam out of a total event inflow volume of 2,650,000 ML. Figure 7.2.4 below shows the estimated base flow component in comparison to the total surface run-off into Wivenhoe Dam from the Upper Brisbane River.

7 FLOOD MODEL VALIDITY AND PERFORMANCE

Cases

A Case is an event-based sequence of processes applied to a number of Regions. Generally, all Regions are included in a Case, which is identified by a unique Case name. The following items are required to define a Case:

- Name and description of Case;
- Simulation start time, current time, simulation finish time and computational time step;
- Rainfall from simulation start time to the current time;
- Rainfall loss model type, required rainfall loss rates and spatial distribution;
- Forecast rainfall duration, depth, spatial and temporal distribution;
- Regions included in Case;
- Hydrologic model routing parameters;
- Reservoir start volume and operating procedure.

In determining appropriate operational strategies, reference is made within these simulation Cases to model estimates at the following locations:

- Wivenhoe Dam Inflow;
- Somerset Dam Inflow;
- Lockyer Creek at O'Reillys Weir (6569);
- Bremer River at David Trumpy Bridge (2168);
- Brisbane River at Lowood (A-6650 and B-6647);
- Brisbane River at Moggill (6755).

The output from a case provides model results that are used in flood event decision-making.

Data

As discussed in detail in Section 5 and Section 6, there were no significant issues observed with the RTFM data collection system during the January 2011 Flood Event.

Deleted: s

Deleted: .0

Deleted: .0

Ratings

A Rating is a unique relationship between height and flow at a water level recording station. A Rating is used to convert the recorded water level to an estimated flow rate. A full list of the ratings in the RTFM is provided in Appendix R.

Formatted: Font color: Red

Ratings are generally derived from field measurements of flow and extrapolated by a variety of techniques for flows that are beyond the range of available field measurements to allow coverage of a full range of potential gauge heights. Therefore there can be considerable uncertainty in the estimation of high flows from recorded water level data, especially at high heights such as those experienced during the current event.

During the January 2011 Flood Event actual water levels exceed the range of available field measurements at a number of gauges. This factor caused additional uncertainty to be associated with the results provided by the RTFM, but this could not be avoided. However, overall this factor did not have a major impact on Flood Event decision making.

Deleted:

Soil Moisture Accounting Model

The spring and early summer rainfall totals were above average for all Regions. Flood producing rainfall was recorded in October 2010 and again throughout late November 2010 and December 2010. Four separate flood events were experienced during this period with the Boxing Day flood finishing on Sunday 2 January 2011. As a consequence of these floods, the catchments were relatively saturated at the commencement of the January 2011 Flood Event as evidenced by the estimates of initial loss shown in the table below.

The Tenthill (TEN) and Laidley (LAI) regions in the Upper Lockyer Creek catchment along with the Kalbar (KAL), Amberley (AMB) and Purga (PUR) regions in the Bremer River catchment, show the effect of isolated storm rainfalls that fell between Tuesday 4 and Wednesday 5 January 2011. The values shown in Table 7.3.1 were used as a starting point for the 'calibration' of the runoff-routing Process.

Table 7.3.1 – Region loss rate estimates at 5 January 2011

During the Event, continuing loss rates were changed to ensure the overall shape and volume of the Flood Event was being matched to an acceptable level. Given the multi-peaked nature of the hydrographs and the prolonged duration of the event, the continuing loss rates tended to reduce as the event progressed and Table 7.3.2 shows the final Event values used in the RTFM.

To continue to produce accurate modelling outputs, the final continuing loss rates adopted were substantially lower than the values initially used. This clearly indicates the increasing impact of catchment saturation over the duration of the Flood Event.

Table 7.3.2 – Region loss rates (final) January 2011

The continuing loss rates contained in Table 7.3.2 are well within the range of those used to model historic flood events including the January 1874 event and certainly within the calibration range of the RTFM. However, while the continuing loss rate has some physical basis, it must also be understood that the continuing loss rate is also an indicator of the quality of the recorded data. The consistency of continuing loss rate estimates between events provides a positive indication that rainfall network provides adequate coverage and that stream gauge ratings are relatively reliable.

Cases

Two basic case scenarios were examined during the event, these being:

- No Forecast Rainfall – accounted for rainfall on the ground to the time of the simulation run;
- Forecast Rainfall – included an extension of rainfall based upon Bureau of Meteorology forecasts (either QPF or SILO).

As is standard practice, during the initial phases of the Event, numerous simulations were conducted. This allows an understanding of the Event to be developed. During this period between rainfall commencing and runoff being recorded at water level gauges, the purpose of the modelling is focused on matching the rising limb of the hydrographs. Once the start of rise of the hydrograph is matched sufficiently, the focus of the modelling is on estimating the peak flow and the volume of the flood, especially for stations located above the Dams. Normally, peak flow rates and flood volumes are matched to at least within 20% of recorded values.

The No Forecast Rain and Forecast Rain scenarios are then examined to establish appropriate operational strategies within lower and upper bound model estimates. Matching of flows at all available gauging stations

7 FLOOD MODEL VALIDITY AND PERFORMANCE

is attempted, with emphasis placed upon the key locations. These key locations for each catchment (with associated ALERT sensor identification numbers) are listed below:

- **Upper Brisbane River**
Brisbane River at Gregors Creek (A) 6515 and (B) 6518
- **Middle Brisbane River**
Brisbane River at Wivenhoe Dam Headwater (A) 6637 and (C) 6638
- **Stanley River**
Stanley River at Woodford (A) 6706 and (B) 6703
Stanley River at Somerset Dam Headwater (A) 6594, (B) 6591 and (C) 6592
- **Lockyer Creek**
Lockyer Creek at Lyons Bridge (A) 6634 and (B) 6631
- **Bremer River**
Bremer River at Walloon (A) 6551 and (B) 6743
Warrill Creek at Amberley (A) 6652 and (B) 6654

The recorded headwater levels and gate settings at each of the Dams are also used to ensure the modelled inflows are appropriate before using projected inflows to determine future gate operations. Manually read gauge board readings obtained from the storage operators are used to validate the automatic gauge information at the Dams and are used in preference to automatic gauge information for operational decision making.

Further points to note in regard to the field stations are as follows:

- At Lyons Bridge both the (A) and (B) stations are subject to bypass flows at flow magnitudes greater than 600m³/s. Therefore, the recorded flows are considered to under estimate larger flood magnitudes. There is also an inconsistency between the (A) and (B) site rating curves. The (A) station was adopted in this Event;
- There is an inconsistency between the Amberley (A) and Amberley (B) site rating curves. The (A) station was adopted in this event;
- David Trumpy Bridge is a height only station as it is also impacted by tidal flows and it too is back-water affected from large flows in the Brisbane River.

During the Event, some Cases were over-written. This occurred because Cases are generally created by using the most recent Case as a base. If the Case being used as a base is not explicitly saved, it will be lost. This does not present a problem from an operational sense as historical Cases quickly become "out of date" as further rain falls in the Dam catchments. "Out of date" Cases have little bearing on current time operational decision making as they do not consider all of the rain that has fallen since the commencement of the flood event to the current time. Cases can also easily be re-created at any time during or after the flood event as all Case data is archived. Table 7.3.3 provides a list of preserved Cases developed during the Flood Event.

Table 7.4 – Model run naming convention

RTFM results

Overall, the RTFM provided sufficient information to properly support flood operations decision making. Water level estimates approximated recorded gauge water levels did not require significant scaling to match recorded lake levels. Generally there was also agreement with the flows estimated by BoM that were made available via their registered user service. An example of this is shown in Figure 7.3.5.

Deleted: 4

Figure 7.3.5 – Comparison of model estimates

Deleted: 4

There was correlation between the results provides between the RTFM and the results provide from the back-up RTFM system utilising the URBS models.

Deleted: z

7 FLOOD MODEL VALIDITY AND PERFORMANCE

The model performance also reflects the robustness of the original model calibrations which were biased towards the larger historical flood events such as January 1974. It is noted that the January 2011 Event has a magnitude that requires extrapolation of the model parameters beyond that for which they were previously benchmarked. It is considered that the availability of numerous rainfall stations in the catchment most significantly contributes positively to the overall model performance.

Deleted: e

In respect of the application of the runoff-routing models in a forecasting mode, it should be noted that the projected flows are not updated using the recorded flows to the time of the simulation but rather, the projected flows are derived from recorded rainfalls with or without a forecast rainfall extension.

Summaries of the results across the four key catchments are contained below.

- **Upper Brisbane River Catchment Model**

The Upper Brisbane River Catchment Model performed well at all locations as evidenced by the comparisons at Gregors Creek. There was some difficulty encountered in the modelling of flows in the Upper and Middle Brisbane Rivers when trying to match the rapid lake level rise in Wivenhoe Dam that occurred on Tuesday 11 January 2011. However, this was due to an absence of data rather than a flaw in the model, as back calculations showed the intense rainfall falling during this period was not adequately captured in the available rain gauges. This issue is discussed in more detail in Section 6.

Deleted: .0

- **Stanley River Catchment Model**

The Stanley River Catchment Model performed adequately and accurate inflow estimates into Somerset Dam were obtained from the modelling results. However, because the Woodford gauge only commands a relatively low percentage (20%) of the total catchment area of Somerset Dam, some scaling was needed to match estimated inflow volumes to recorded lake levels. This is because substantial event runoff was generated on the Jimna and D'Aguiar Ranges that flowed directly into Lake Somerset. Therefore, the flow at Woodford was not totally representative of all the contributing catchment of the Stanley River. Again, this is a data availability issue rather than a modelling issue.

- **Lockyer Creek Catchment Model**

The Lockyer Creek Catchment Model performed well and generally matched with catchment flows estimated by BoM. The flash flooding episode experienced on the Toowoomba Range escarpment on the afternoon of Monday 10 January 2011, showed the intense rainfall falling during this period was not adequately captured in the available rain gauges.

Two stream gauges in the Upper Lockyer Creek catchment failed during the course of the Event due to overtopping, whilst the most downstream gauge became back-water affected before it failed. Therefore, stream flow matching of the modelling results was undertaken at Glenore Grove and Lyons Bridge. For flows larger than 600m³/s, Lyons Bridge suffers from bypass flows and therefore it tends to under estimate larger flood events. This is evident of the results contained in the following tables and was accounted for during the Event when estimating flows at Moggill. Comparisons between model results shared with BoM confirm that the peak flow in Lockyer Creek was in excess of 3,000m³/s.

- **Bremer River and Warrill Creek Catchment Model**

The Bremer River and Warrill Creek Catchment Model performed well and generally matched with catchment flows estimated by BoM. Some timing differences were noted, particularly on Warrill Creek. The rating of the Bremer River at Walloon was exceeded during the event and so this curve will need to be extrapolated post-event to define the peak flow at this location. Upstream stations on the Bremer River indicated good matching for the event.

Table 7.3.5 contains calibration results showing the values of peak flow and flood volume to the date and time of the model run. Timing issues result in over or under estimation of peak values and in many instances the recorded values are not necessarily peak values, but rather the latest value on the rising limb. Plots of comparisons between recorded and modelled hydrographs are presented in Appendix S.

Formatted: Font color: Red

It should be noted that the results in Table 7.3.6 are surface run-off results only and contain no baseflow. Therefore, the values shown in this table will be lower than those shown in the gate operations spreadsheets and the final modelling results.

Deleted: 5

Deleted: T

7 FLOOD MODEL VALIDITY AND PERFORMANCE

Finally, the results shown in Table 7.3g are based on unverified stream height data and associated Ratings. Although the values shown in the Tables are presented to the nearest m³/s or ML, the level of precision should be not be inferred from this level of reporting.

Run 2 - 08:00 Thursday 6 January 2011

This run was completed soon after mobilisation of the Flood Operations Centre. Rainfall commenced the pervious day with the largest falls occurring in the Upper Brisbane River and Lockyer Creek catchments.

Stream gauge	Estimated		Modelled		Difference	
	Peak flow (m ³ /s)	Flood volume (ML)	Peak flow (m ³ /s)	Flood volume (ML)	Peak flow (m ³ /s)	Flood volume (ML)
Gregors Creek	117	13,381	357	15,847	240	2,466
Woodford	4	1,998	8	125		-1,874
Lyons Bridge	44	12,257	95	4,860	52	-7,397
Walloon	38	480	116	6,426	77	5,946
Amberley	26	6,084	203	5,471	177	-612

Run 5 - 02:00 Friday 7 January 2011

This run was completed 19 hours after mobilisation of the Flood Operations Centre. Flows in the Upper Brisbane River had just peaked, whilst the Lockyer Creek and Bremer River catchments continued to rise.

Stream gauge	Estimated		Modelled		Difference	
	Peak flow (m ³ /s)	Flood volume (ML)	Peak flow (m ³ /s)	Flood volume (ML)	Peak flow (m ³ /s)	Flood volume (ML)
Gregors Creek	986	40,737	1,302	67,830	316	27,093
Woodford	14	2,227	44	797	30	-1,430
Lyons Bridge	412	22,230	315	14,327	-97	-7,903
Walloon	336	7,429	88	6,291	-248	-1,138
Amberley	73	8,125	124	4,893	51	-3,232

Run 7 - 09:00 Friday 7 January 2011

This run was completed 26 hours after mobilisation of the Flood Operations Centre. Warrill Creek continued to rise but all other streams had peaked and were receding.

Stream gauge	Estimated		Modelled		Difference	
	Peak flow (m ³ /s)	Flood volume (ML)	Peak flow (m ³ /s)	Flood volume (ML)	Peak flow (m ³ /s)	Flood volume (ML)
Gregors Creek	986	59,062	1,302	84,378	316	25,316
Woodford	14	2,394	63	1,446	49	-948
Lyons Bridge	422	32,566	447	24,429	25	-8,137
Walloon	412	16,791	89	8,449	-323	-8,342
Amberley	117	10,629	124	6,938	7	-3,691

Run 10 - 14:00 Saturday 8 January 2011

This run was completed 55 hours after mobilisation of the Flood Operations Centre. The Upper Brisbane River had peaked for a second time and was now receding. The Stanley River and Warrill Creek were also falling. Secondary peaks in Lockyer Creek and Bremer River were now falling.

Stream gauge	Estimated		Modelled		Difference	
	Peak flow (m ³ /s)	Flood volume (ML)	Peak flow (m ³ /s)	Flood volume (ML)	Peak flow (m ³ /s)	Flood volume (ML)

Amberley	164	25,976	210	24,026	46	-1,950

Run 12 - 01:00 Sunday 9 January 2011

This run was completed 66 hours after mobilisation of the Flood Operations Centre. All streams appeared to be receding, although heavy rainfall falling on all catchments suggested another rise was likely to occur.

7 FLOOD MODEL VALIDITY AND PERFORMANCE

Run 14 - 08:00 Sunday 9 January 2011

This run was completed 73 hours after mobilisation of the Flood Operations Centre. Large increases in flows were expected in the Upper Brisbane River, Stanley River and Bremer River as a result of continuing rainfall. Inflows into Somerset Dam and Wivenhoe Dam were expected to exceed 500,000 ML.

Stream gauge	Estimated		Modelled		Difference	
	Peak flow (m ³ /s)	Flood volume (ML)	Peak flow (m ³ /s)	Flood volume (ML)	Peak flow (m ³ /s)	Flood volume (ML)

Amberley	164	32,719	210	27,172	46	-5,547

Run 17 - 14:00 Sunday 9 January 2011

This run was completed 79 hours after mobilisation of the Flood Operations Centre. Rapid rises occurred in the Upper Brisbane River, with associated increased runoff volumes into both Somerset Dam and Wivenhoe Dam.

Stream gauge	Estimated		Modelled		Difference	
	Peak flow (m ³ /s)	Flood volume (ML)	Peak flow (m ³ /s)	Flood volume (ML)	Peak flow (m ³ /s)	Flood volume (ML)

Amberley	164	34,158	210	29,641	46	-4,517

Run 21 - 19:00 Sunday 9 January 2011

This run was completed 84 hours after mobilisation of the Flood Operations Centre. Heavy rainfall in the Upper Brisbane River and Stanley River catchments suggested peak flow rates similar to February 1999. Inflows into Somerset Dam and Wivenhoe Dam were expected to exceed 1,000,000 ML.

7 FLOOD MODEL VALIDITY AND PERFORMANCE

Run 23 - 01:00 Monday 10 January 2011

This run was completed 90 hours after mobilisation of the Flood Operations Centre. Upper Brisbane River catchment peaked at a level in excess of January 1974. Lockyer Creek and Bremer River catchments were rising again.

Run 28 - 15:00 Monday 10 January 2011

This run was completed 104 hours after mobilisation of the Flood Operations Centre. Rainfall was causing rises again in the Upper Brisbane River and Lockyer Creek. Flash-flooding was reported in Toowoomba and Upper Lockyer Creek. Inflows into Somerset and Wivenhoe Dams were approaching 1,500,000 ML.

7 FLOOD MODEL VALIDITY AND PERFORMANCE

Run 31 - 20:00 Monday 10 January 2011

This run was completed 109 hours after mobilisation of the Flood Operations Centre. Lockyer Creek and the Bremer River catchments were continuing to rise. Gauging stations in the Upper Lockyer Creek stopped reporting (Heldon and Gallon).

Run 35 - 04:00 Tuesday 11 January 2011

This run was completed 117 hours after mobilisation of the Flood Operations Centre. Heavy rainfall overnight in the Upper Brisbane River catchment lead to renewed rises. Lockyer Creek continued to rise due to flash flooding near the escarpment during the previous afternoon. Bremer River also continued to rise.

Run 37 - 08:00 Tuesday 11 January 2011

This run was completed 121 hours after mobilisation of the Flood Operations Centre. Heavy rainfall adjacent to Wivenhoe Dam lead to rapid increases in lake level since 04:00. Lockyer Creek continued to rise quickly whilst the Bremer River catchment appeared steady. Inflows into Somerset Dam and Wivenhoe Dam were approaching 2,000,000ML.

7 FLOOD MODEL VALIDITY AND PERFORMANCE

Run 39 - 13:00 Tuesday 11 January 2011

This run was completed 126 hours after mobilisation of the Flood Operations Centre. The Upper Brisbane River catchment had peaked, however, continuing heavy rainfall adjacent to Wivenhoe Dam caused further rapid increases in the lake level. Somerset Dam inflows also increased rapidly. Lockyer Creek continued to rise quickly and the Bremer River catchment also experienced substantial renewed rises.

Run 41 - 19:00 Tuesday 11 January 2011

This run was completed 132 hours after mobilisation of the Flood Operations Centre. Wivenhoe Dam had peaked. Woodford was rising rapidly and Somerset Dam inflows also increased. Lockyer Creek appeared to have peaked, but the model grossly overestimated the rated flow. However, comparisons with BoM estimates indicated the modelled flows may be reasonable. The Bremer River at Walloon exceeded its rating curve, whilst Warrill Creek continued to rise.

7 FLOOD MODEL VALIDITY AND PERFORMANCE

Run 45 - 12:00 Wednesday 19 January 2011

This run was completed 317 hours after mobilisation of the Flood Operations Centre. Gate operations ceased at Wivenhoe Dam. Little rain fell on the catchment in the week following the peak on Tuesday 11 January 2011. This was the final simulation run. Minor adjustments to loss parameters resulted in minor changes to the model calibration results compared to Run 43. Inflows into Somerset Dam and Wivenhoe Dam approached 2,350,000ML (excluding base flow).

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

8.1 Introduction

The significance of this Event can be determined by comparing rainfall, water levels and flood volumes measured during the period with historical records and then undertaking a statistical analysis of this information. Australian Rainfall and Runoff (ARR) categorises events according to their Annual Exceedance Probability (AEP), as illustrated in Figure 8.1.1. The Bureau of Meteorology adopts a flood classification system based on minor, moderate and major flood levels which are defined by BoM in conjunction with local Councils.

Deleted: 7

Figure 8.1.1 – Annual Exceedance Probability (AEP)

It should be noted that the assessments carried out in this Section of the report are preliminary only and are based upon operational data collected during the event. Given that time constraints for preparation of the report, it is recognised that more information may become available on which to base a more rigorous assessment of the event magnitude.

Rainfall totals and intensities can be compared with those recorded during other significant events to determine the significance of the January 2011 Event. Rainfall stations in the Brisbane catchment have good record lengths that, in some cases, are greater than 100 years and therefore provide an effective basis for analysis. The analysis of rainfall intensity rather than depth provides a good indicator of the magnitude of floods in terms of peak flows and volumes.

Water level stations generally have shorter record lengths than rainfall stations, leading to a greater level of uncertainty when comparing recorded and historic water level data to determine event significance. Automatic stations have only been in widespread use since the 1960s, so continuous water level records are generally only available for maximum periods of around 50 years.

Detailed flood frequency analysis consisting of at-station statistical analysis of flow records, requires extensive investigation based on a reassessment of station ratings to account for the current Event. This reassessment work is currently being undertaken by the Department of Environment and Resource Management (DERM) and was not available at the time of writing this Report. However, some preliminary flood frequency analysis was undertaken using available records and this information is included in this Report.

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

8.2 Rainfall depth and intensity comparison

In the four weeks prior to Thursday 6 January 2011, rainfall in South East Queensland had been well above the December average. In some areas, rainfall exceeded the December average by as much as 400mm. These results can be seen in the following map (Figure 8.2.1) provided by BoM:

Deleted: 7

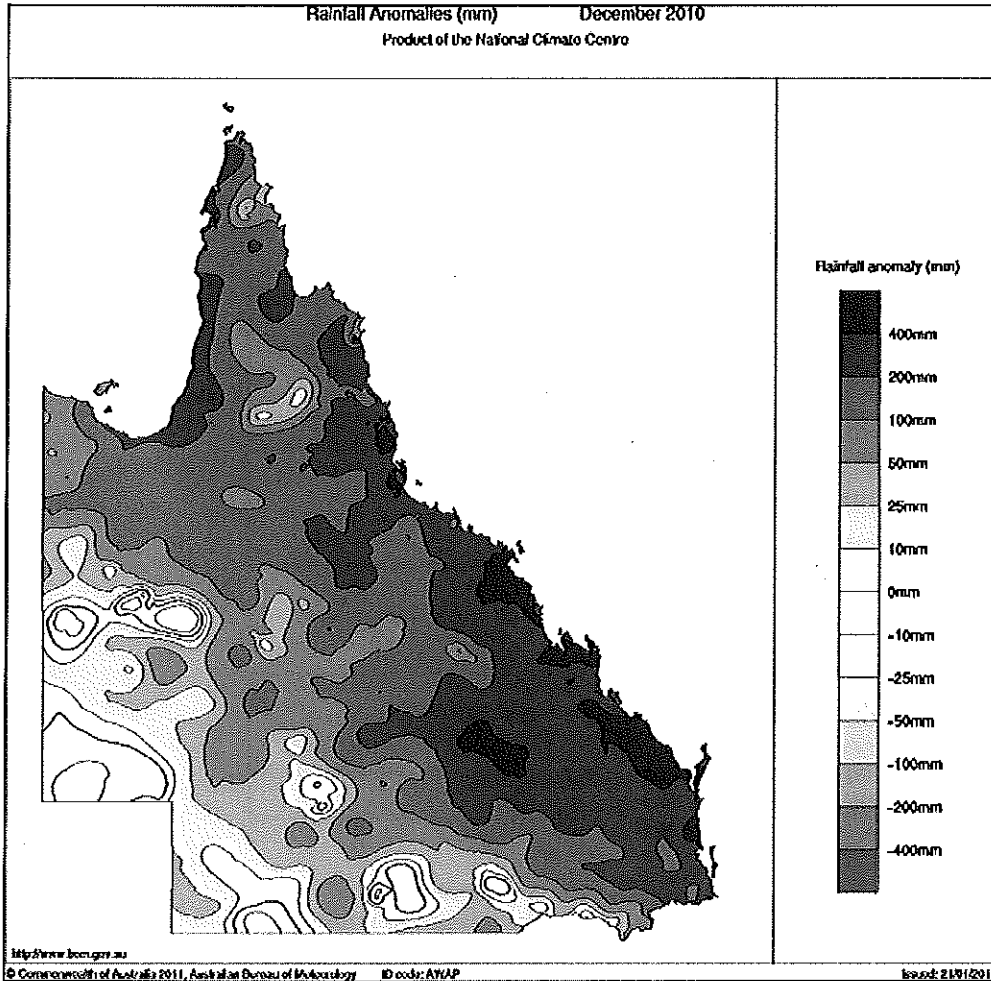

Figure 8.2.1 – Queensland Rainfall (mm), December 2010

There had already been two significant rainfall events in mid and late December 2010 which required large releases from Somerset and Wivenhoe Dams. As a result of these events and the above average rainfall that had been experienced, the Brisbane catchment was wetter than would normally be expected at this time of year and primed to generate runoff from relatively low rainfall events.

Historic comparison

Table 8.2.2 shows a comparison between the event rainfall totals from the January 1974, February 1999 and January 2011 flood events. The comparison could not include the February 1893 events as the available rainfall records are inadequate to allow a proper comparison.

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

The first feature to notice in Table 8.2.2 is that the duration the events vary from three days to eight days. This has implications for the runoff generating efficiency of the rainfall, as the longer the event duration, the more saturated the catchment becomes and the greater the proportion of runoff per period. This was particularly relevant for the January 2011 Flood Event as the catchment was already relatively saturated at the beginning of the Event.

Table 8.2.2 also shows that the depth of rainfall in the February 1999 flood is much less than the other two events. While the five day totals in the January 1974 and January 2011 are quite similar, the distribution of rainfall with time is quite different and this had a major impact on the volume of runoff generated during each event.

Table B.2.3 – Comparison of rainfall totals for selected durations (mm); January 1974, February 1999 and January 2011

Figures 8.2.4 and 8.2.5 shows a comparison of the average hourly catchment rainfall patterns in the Somerset Dam and Wivenhoe Dam catchments during the January 1974, February 1999 and January 2011 flood events. Each of the graphs have been plotted on the same horizontal (eight days) and vertical (25mm/hr) scales to enable direct comparison.

The plots of the January 1974 and February 1999 flood events utilise all available rainfall data including daily rainfall records, while the plots of the January 2011 Flood Event only utilises the operational data collected during the Event. All three plots use the same approach of weighting the four nearest rainfall stations to estimate the average catchment rainfall for each subarea in Seqwater's URBS model. Weights were determined using the inverse distanced squared method. The catchment average rainfall is then calculated by weighting each subarea in relation to the total catchment area.

Somerset Dam catchment (Figure 8.2.4)

In the Somerset Dam catchment, the rainfall intensities in the 1974 flood were generally between 3mm/hr to 8mm/hr over the four day duration of the event. By comparison, intensities in the February 1999 flood were slightly higher but over a much shorter period. In January 2011, there are several burst of rainfall between 5mm/hr and 10mm/hr over short durations, leading up to a prolonged period of heavy rain where two periods of very intense rain were experienced (in the 12 hours ending 18:00 Sunday 9 January 2011 and the 12 hours ending 18:00 Tuesday 11 January 2011). During these periods, intensities were more than double those recorded in 1974 and 1999.

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

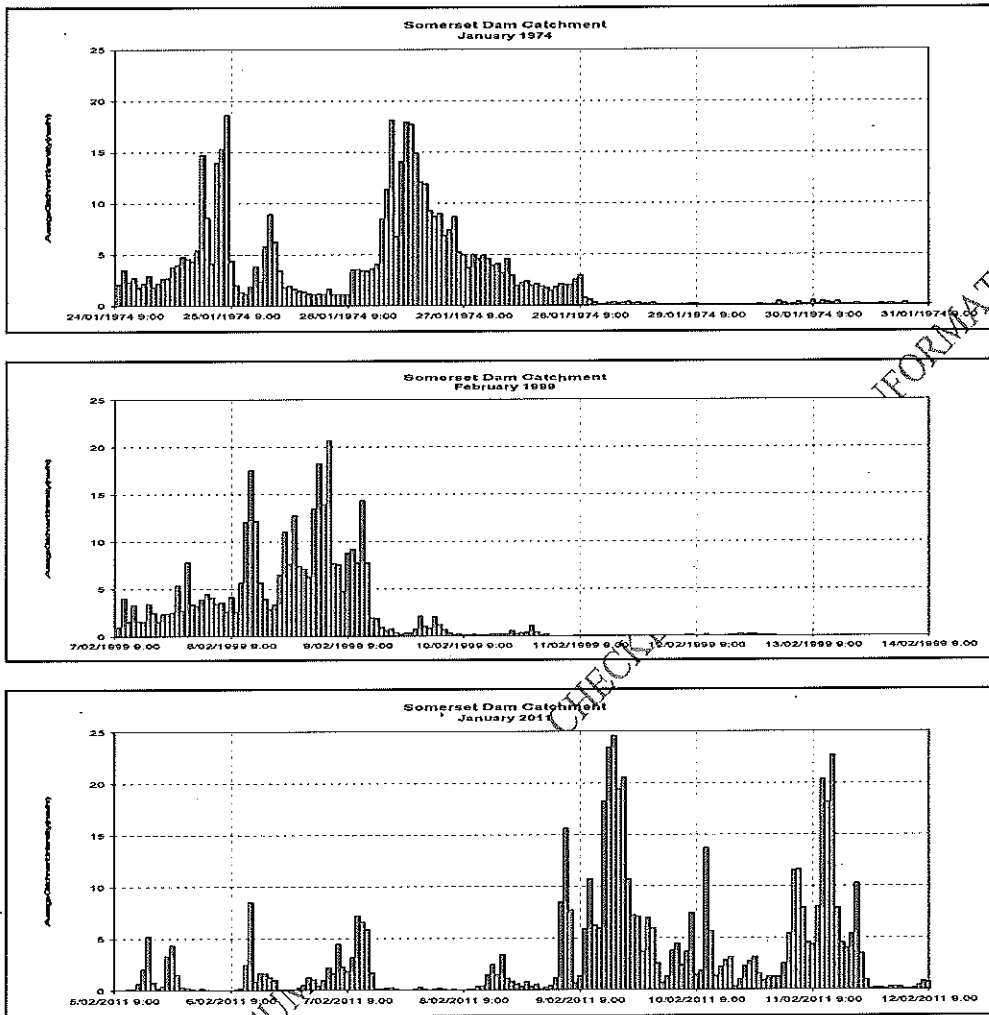

Figure 8.2.4 – Comparison of Somerset Dam catchment rainfall patterns (mm/hr); January 1974, February 1999 and January 2011

Wivenhoe Dam catchment (excluding the Somerset Dam catchment) (Figure 8.2.5)

In the Wivenhoe Dam catchment, the rainfall intensities during the 1974 flood were generally between 3mm/hr to 8mm/hr over the four day duration of the event. By comparison, intensities in the February 1999 flood were slightly higher but over a much shorter period. In January 2011, the average catchment rainfall tended to build up slowly over the first four days during which time a number of small floods were experienced. The first burst of heavy rainfall occurred in the 12 hours to 00:00 Monday 10 January 2011. This was followed by a shorter two hour burst on the afternoon of Monday 10 January 2011. The final and heaviest catchment burst occurred in the early hours of Tuesday 11 January 2011. Rainfall intensities in the January 2011 Event were nearly double those of January 1974.

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

8.3 Rainfall intensity frequency duration analysis

Intensity Frequency Duration (IFD) analysis refers to the statistical analysis of rainfall intensities. Rainfall is typically described as depth in millimetres (mm) falling over a specified duration or period in hours. The rainfall rate or intensity is usually defined as the depth of rainfall per hour.

To determine the severity of a particular rainfall event, the intensity over particular periods of interest is compared with historical records to determine its frequency of occurrence. The Annual Exceedance Probability (AEP) is used to define this frequency of occurrence and is defined by BoM as "the probability that a given rainfall total accumulated over a given duration will be exceeded in any one year."

Depth and intensity may be used in IFD analysis however BoM prefers to simply use rainfall intensity (mm/h). There are two generally accepted methods for IFD analysis:

- Australian Rainfall and Runoff (IEAust 1987);
- CRC-FORGE (Hargraves, 2004 & 2005).

Appendix B contains the analysis for both of these methodologies for a range of rainfall gauges in the Dam catchments for the January 2011 Flood Event. The Australian Rainfall and Runoff (IEAust 1987) results are also available in real time within the RTFM and are used to assess the progression of flood events.

In the Brisbane River Catchment the CRC-FORGE method and Australian Rainfall and Runoff produce similar estimates for 1% AEP for durations from 24 hours to 72 hours. The CRC-FORGE method is the only IFD method used in relation to dams that provides design rainfall estimates for durations up to 120 hours.

The CRC-FORGE method is based upon a regional rainfall frequency analysis that derives rainfall depth estimates of large to rare flood events and uses the concept of an expanding region focused at the site of interest. When using CRC-FORGE, design rainfall estimates for frequent events (1 in 50 and 1 in 100 AEP) are based on pooled data from a few stations around the focal point, while design rainfall estimates at the AEP limit of extrapolation (1 in 2,000) are based on pooled rainfall data from up to several hundred stations. Before data from different sites can be pooled, maximum annual rainfalls from each site need to be standardised by dividing by an index variable. The index variable may be the mean annual maximum for the site, or rainfall of any specified AEP that is reasonable and accurately determined from a short record. An Areal Reduction Factor (ARF) is also introduced to correct the variation of rainfall intensity over a large catchment area and to convert point rainfall estimates to areal estimates.

The CRC-FORGE method was developed using daily rainfall totals. It should be noted that there is some uncertainty in the AEP estimates of the recorded rainfall produced by the CRC-FORGE method for durations less than 24 hours. The shorter durations are extrapolated using ratios calculated from Australian Rainfall and Runoff. There are experimental techniques available for investigating the AEP for the shorter duration rainfalls but time constraints associated with the preparation of this report have not allowed this to be included in the analysis. Given the focus of this IFD analysis is mostly on longer duration storms, the approach undertaken for this report is considered appropriate.

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

Point IFD Analysis

For the January 2011 Event, the CRC-FORGE method was used to derive rainfall estimates for frequent to rare flood events for storm durations from 15 minutes to 120 hours, for both point and areal estimates. As discussed above there is some uncertainty associated with design rainfall estimates below 24 hour duration so these curves are shown dotted in the plots below. Point IFD analysis was carried out for each gauge in the rainfall network listed in Table 8.3.1.

Table 8.3.1 – Rainfall stations IFD analysis

Significant stations in each catchment were selected for inclusion in this section of the Report. The remainder of the IFD tables and curves for other stations are included in Appendix P.

Table 8.3.2 summarises the highest AEPs at particular stations estimated from an IFD analysis of the entire list of stations in the tables above. The table shows that for durations of more than three hours, the highest AEPs of the recorded rainfall were 1 in 500 or greater.

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

January 2011 Flood Event - Highest rainfall intensities

120 H	6649	Lowood	4.0	01:04 12/01/2011	500 - 1000

Table 8.3.2 - Highest AEP rainfall intensities, January 2011 Flood Event

IFD results for significant individual stations are defined further in this section. Discussions on temporal patterns are also contained in Section 6.0. Overall, there was significant spatial variation in the rainfall intensities. Intensities were generally very high in the catchment above Somerset and Wivenhoe Dams however they were not statistically significant at stations below the Dams. It should also be noted the rainfall which caused the Lockyer Creek flash flood was not recorded in any of the Seqwater stations.

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

Gregors Creek

This station is located near the Brisbane River around 49km north of Wivenhoe Dam and is close to the centre of the Wivenhoe Dam catchment. Figure 8.3.3 below shows the heaviest rainfall up to 18 hours was recorded on the afternoon of Sunday 9 January 2011. For durations less than three hours, the AEP was not particularly significant however, between 18 and 24 hours, the AEP of the rainfall was in the 1 in 100 to 1 in 200 range. By 20:00 Tuesday 11 January 2011, the longer rainfall periods up to 120 hours are consistently in the 1 in 100 to 1 in 200 range.

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

Cooyar Creek Dam Site

This station is located within the lower reaches of Cooyar Creek, around 85km north north-west of Wivenhoe Dam, near the northern boundary of the Wivenhoe Dam catchment. Figure 8.3.4 below shows the shorter duration rainfall up to 24 hours was not statistically significant and mostly occurred in the period up to late Monday 10 January 2011 to early Tuesday 11 January 2011. By Tuesday 11 January 2011, the longer rainfall periods up to 120 hours are consistently in the 1 in 50 to 1 in 100 range.

Figure 8.3.4 - Rainfall Intensity, Cooyar Creek

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

Glenore Grove

This station is located within the lower reaches of Lockyer Creek, around 24km south west of Wivenhoe Dam.

Figure 8.3.5 below shows the most intense rainfall for all durations ended in the evening of Tuesday 11 January 2011. The rainfall which fell in the afternoon of that day was up to 1 in 500 AEP and coincided with the arrival of floodwaters from the previous afternoon's heavy rainfall in the upper reaches.

Figure 8.3.5 - Rainfall Intensity, Glenore Grove

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

Toowoomba

This station is located within the watershed of the Condamine River Basin and Lockyer Creek, around 66km south-west of Wivenhoe Dam. Figure 8.3.6 below shows the most intense rainfall for periods of less than 12 hours ended on the afternoon of Monday 10 January 2011. The rainfall for these durations is not particularly significant, being in the frequent to large range. However, despite its location, the rainfall at this gauge is not considered to accurately represent the rainfall which caused the flash flood in the Lockyer Valley on the afternoon of Monday 10 January 2011.

Figure 8.3.6 - Rainfall intensity, Toowoomba

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

Lowood

This station is located only 8.5km south of Wivenhoe Dam, in the area which recorded some of the highest Event rainfall totals. Figure 8.3.7 below shows the rainfall at this location had AEPs for durations above 6 to 48 hours to be above 1 in 2000 and is estimated to be in the rare range. The IFD graph shows the 12 hour duration rainfall was significantly above the 1 in 2000 AEP and extended into the extreme range. The timing of the short duration rainfall should also be noted. On the afternoon of Tuesday 11 January 2011, this rainfall coincided with the arrival of floodwaters from the upper Brisbane River into Wivenhoe Dam and the arrival of the Lockyer Creek floodwaters into the Brisbane River.

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

Bellthorpe West

This station is located in the northern part of the Stanley River catchment, around 35km north-east of Somerset Dam on the catchment boundary with the Mary River. The table in Figure 8.3.8 below highlights that for durations of between 6 and 48 hours, the AEP of the recorded rainfall was between 1 in 50 and 1 in 100. Beyond 48 hours, AEPs were between the 1 in 100 and 1 in 200 range.

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

8.4 Catchment rainfall Intensity Frequency Duration (IFD) analysis

While Point IFD analysis demonstrates the rainfall intensity in the immediate vicinity of the station, it does not indicate the significance of the rainfall over the entire catchment. The catchment average rainfall is determined by applying a weighting to each station in the network, then adding up the weighted station rainfall for each period of the analysis. Catchment IFD analysis derived using CRC-FORGE is based upon assumed idealised spatial and temporal patterns which can be quite different to the actual Event rainfall distributions.

By their nature, catchment average rainfall intensities tend to be lower than Point intensities due to the spatial variation of rainfall through the catchment with some areas recording higher rainfall than others. This is particularly true for relatively large catchments such as the total Wivenhoe Dam catchment (including Somerset Dam). However, the AEPs for the total Wivenhoe Dam catchment were between the 1 in 100 and 1 in 200 range for rainfall durations between 72 hours and 120 hours, and this fact certainly highlights the significance of the Event.

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHECKED OR VERIFIED INFORMATION

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

Somerset Dam catchment

Although the catchment average rainfall intensities in this catchment were generally less intense than that in the Wivenhoe Dam catchment, AEPs for the Somerset Dam catchment in the 1 in 50 to 1 in 100 range for rainfall durations greater than 48 hours certainly highlight the significance of the Event.

Duration	Recorded intensity	End time	AEP

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

Wivenhoe Dam catchment (Including the Somerset Dam catchment)

The AEPs for the Wivenhoe Dam catchment were between the 1 in 100 and 1 in 200 range for rainfall durations between 72 hours and 120 hours.

Duration	Recorded intensity mm/hr	End time	AEP 1 in Y
1 H	17.5	9/01/2011 15:00	<5
3 H	15.0	9/01/2011 16:00	<5
6 H	13.8	9/01/2011 19:00	10-20
12 H	10.1	9/01/2011 22:00	20-50
18 H	7.9	9/01/2011 23:00	20-50
24 H	6.4	10/01/2011 4:00	20-50
48 H	5.7	11/01/2011 13:00	50-100
72 H	4.7	11/01/2011 19:00	100-200
96 H	3.6	12/01/2011 13:00	100
120 H	3.2	11/01/2011 21:00	100-200

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

8.5 Comparison of flood volumes

While flood peaks are an important feature for the comparison of events, flood volumes are especially critical in the operation of dams. For this reason, flood volumes were compared. Table 8.5.1 below compares flood volumes across a selection of recent and historical events in the Brisbane River at the location of Wivenhoe Dam. It should be noted that these events occur over different time periods.

Dams have a significant mitigating impact and the construction dates for each Dam in the Basin is:

- Somerset Dam 1955;
- Cressbrook Dam 1982;
- Wivenhoe Dam 1985.

Table 8.5.1 shows that the volume of the January 2011 Flood Event is almost double (190%) the volume of the January 1974 flood and rivals the February 1893 flood. The volumes of pre 1968 floods are estimated from models studies of these events.

Event	Somerset Dam			Wivenhoe Dam			
	Peak elevation	Stanley River	Outflow	Peak elevation	Upper Brisbane River only	Total	Outflow
	m AHD	ML	ML	m AHD	ML	ML	ML
Feb 1893 ¹		1,361,000			1,383,000	2,744,000	
Feb 1931		150,000			570,000	720,000	
Mar 1955	103.47	390,000	340,000		560,000	900,000	
Jan 1968	na	540,000	380,000		440,000	820,000	
Jan 1974	106.57	620,000	450,000		960,000	1,410,000	
Jun 1983	101.58	260,000	280,000		800,000	1,080,000	470,000

Table 8.5.1 – Recent and historical event flood volumes in the Brisbane River at Wivenhoe Dam

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

8.6 Comparison of flood levels

Table 8.6.1 compares the peak water levels reached during the January 2011 Flood Event with historical floods. The flood of February 1893 is generally regarded as one of the largest on record. Estimates exist of possible larger floods occurring in 1841 and 1867 at the Brisbane Port Office gauge however, there are no records at upstream stations to enable any comparison to be undertaken.

The flood of 1974 is certainly the best documented major flood event impacting Brisbane and provides a useful comparison. The February 1999 flood was larger than the January 1974 flood in the upper Brisbane River however its impact on the urban areas of Ipswich and Brisbane was mitigated by Wivenhoe and Somerset Dams.

A number of points in the table stand out as being significant:

- The peak levels reached at stations in the upper Brisbane River above Wivenhoe Dam were the highest on record;
- Peak water levels reached in the Lockyer Creek area were the highest on record at Gatton, Glenore Grove and Lyons Bridge, easily exceeding the levels reached in the January 1974 and perhaps even the 1893 flood;
- Below Wivenhoe Dam, the level reached at Savages Crossing was around 0.36m higher than in 1974 however the peak level reached at Mt Crosby was around 0.62m lower;
- With a few exceptions, most water levels stations in the Brisbane River basin recorded peak water levels well above major flood level.

ALERT ID	STATION	Feb 1893 m	Jan 1974 m	Feb 1999 m	Jan 2011 m	Jan 2011 Flood Classification	Comments

Table 8.6.1 – January 2011 peak water levels compared with other historical floods

Until the construction of Wivenhoe Dam was completed, BOM operated a flood warning station at Caboonbah, just below the junction of the Stanley and Brisbane Rivers, well upstream of Wivenhoe Dam. Records show levels at this station reached 22.63m in 1893 and 16.32m in 1974, with estimated peak flows of approximately 13,000m³/s and 5,500m³/s respectively. The estimated peak flow at this location in the January 2011 Event was at least 8,500m³/s.

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

8.7 Flood frequency analysis

The annual flood series showing the largest flood in a water year (1 October to 30 September) was extracted from the DERM website at 143007a Linville (1966-2005) and 143009a Gregors Creek (1962-2005). A Generalised Extreme Value (GEV) flood frequency analysis of these flows was undertaken, with the results shown below. This analysis is preliminary and is subject to reassessment of the rating at these sites and inclusion of post 2005 records, including records from the January 2011 Flood Event.

The two peaks at each of Linville and Gregors Creek stations associated with the January 2011 Flood Event were significantly higher than any other flood on record. Individually, the pre January 2011 peaks at both stations are considered to be significantly rarer than the AEP of the 1974 flood of 1 in 75. The probability of two new higher flood peaks occurring within 36 hours of each other as occurred during the January 2011 Flood event is considered to be appreciably uncommon and demonstrates the rarity of the January 2011 Flood Event.

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHECKED OR VERIFIED INFORMATION

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

Brisbane River at Linville

Analysis of the data at Linville suggests the 1974 flood had an AEP of around 1 in 75. Given the January 2011 flood peak was more than 2 metres higher than the 1974 flood suggests the January 2011 flood peak was significantly rarer than 1 in 100 AEP.

Figure 8.7.1 – Flood frequency analysis, Linville

DRAFT ONLY - THIS DOCUMENT CONTAINS

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

Brisbane River at Gregors Creek

Prior to January 2011, the largest recorded flood at Gregors Creek was the January 1974 flood which reached a gauge height of 14.14m. The flood frequency analysis suggests this flood peak had an AEP of about 1 in 75. The January 2011 flood peak at Gregors Creek was some 0.35 metres higher than 1974 suggesting an AEP rarer than 1 in 75.

Figure 8.7.2 – Flood frequency analysis, Gregors Creek

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

8.8 Design flood comparisons

Some care should be exercised when comparing actual flows and volumes with design flows and volumes. The later are based upon idealised design storms distributed in time and space combined with average catchment conditions. These circumstances are not necessarily directly comparable with actual events such as the January 2011 Flood Event. However, these design cases do provide an indicative comparison.

Somerset Dam

Seqwater undertook a review of the design flood hydrology for Somerset Dam in October 2009 (*Somerset Dam Design Flood Hydrology, Draft Report, October 2009*).

A 48-hour design storm generated a peak inflow of 5,000m³/s and an inflow volume of around 770,000ML reaching a peak level of 105.19m in a 1 in 1,000 AEP event. This compares with the January 2011 Event that produced a similar peak inflow of about 5,000m³/s, an inflow volume of 825,000ML and reached a peak level of 105.11m.

Wivenhoe Dam

The design flood hydrology for Wivenhoe Dam was reviewed and upgraded in 2005 (*Wivenhoe Alliance, Design Discharges and Downstream Impacts of the Wivenhoe Dam Upgrade, Q1091, 2005*) as part of the spillway augmentation. Using this report, significant comparisons with the January 2011 Event can be made.

- The report indicates the 36 hour design storm generates the highest peak inflow for all AEPs. The estimated peak inflow of the January 2011 Event was estimated to be around 12,000m³/s, equating to an AEP of around 1 in 1,000.
- The report also indicates the first fuse would be initiated in an event with an AEP of 1 in 6,000. This is consistent with the peak water level of 74.97m which was reached during the January 2011 Event.
- The report estimated the volumes of the design inflow hydrographs for a range of durations and AEPs. For an AEP of 1 in 2,000, the design inflow volumes range from 2,000,000ML to 2,225,000ML for durations of between 48 and 120 hours. Given the January 2011 Event inflow volume to Wivenhoe Dam was estimated to be 2,650,000ML over eight days, the AEP of the flood volume is around 1 in 2,000.

The design inflow and outflows derived from the Wivenhoe Alliance report are illustrated in Figure 8.8.1 below.

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

Figure 8.8.1 – Wivenhoe Alliance report, design inflow and outflows

The 48-hour design flows for Somerset only and Upper Brisbane only flows are contained in Appendix G of the Manual. Comparison of the actual flows with the flows shown in this Appendix also indicates the Event inflows could be considered as a rare occurrence.

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

8.9 Impact of intense rainfall occurring on Tuesday 11 January 2011

As discussed in Section 6, heavy, localised, intense rainfall around the Wivenhoe Lake area commenced in the early hours of Tuesday 11 January 2011 and continued into the afternoon.

This rainfall was recorded in the rain gauges to the east and south of Lake Wivenhoe, around Mt Glorious and Lowood however, it was not recorded in gauges to the north and west of Wivenhoe Dam. There is a large unmonitored area between these gauges which covers a large component of the Lake area. For modelling purposes, this area is treated as impervious and generates 100% runoff. Radar images at the time indicated rain was falling continuously in this area over the period. Rainfall totals in the 12 hours to 15:00 ranged from 410 millimetres at Mt Glorious in the eastern side of the Lake to only 32 millimetres at Rosentretters on the western side of Lake Wivenhoe.

The real time modelling undertaken with the available recorded rainfall data did not reproduce the rapid rise in Lake level recorded that afternoon. This inferred very heavy rainfall fell within and around the Wivenhoe Dam Lake area immediately upstream of the Dam. This suggestion was tested using the Seqwater URBS model using the following methodology.

The recorded Mt Glorious rainfall was transposed to a dummy station at the centre of the Lake and, for the period of heavy rainfall, scaled up the URBS model re-run and the resultant flows imported into the gate operations spreadsheet. The modelled water levels were then compared with the recorded water levels. Figure 8.9.1 below shows the impact of the scaled rainfall on the modelled Upper Brisbane River inflow to Wivenhoe Dam. The peak of the inflow is both much higher and earlier with the transposed dummy rainfall station than without.

Figure 8.9.1 – Impact of scaled rainfall on the upper Brisbane River inflow to Wivenhoe Dam

The recalculated inflows with the dummy rainfall station more accurately reproduced the recorded water levels than the originally modelled inflows, as shown in Figure 8.9.2 below.

Deleted: 1

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

Figure 8.9.2 – Recalculated inflows to Wivenhoe Dam

In order to reproduce the recorded Wivenhoe Dam levels, it was necessary to scale the rainfall of the transposed Mt Glorious data by a factor of two for the period between 03:00 to 15:00 Tuesday 11 January 2011, indicating the significance of the heavy rainfall in the ungauged area immediately upstream of the Dam.

IFD analysis of the rainfall record at Mt Glorious shows the 12 hours to 15:00 Tuesday 11 January 2011 had an average intensity of 33.9mm/hr and was in the range 1 in 500 to 1 in 1,000 AEP, between the large and rare categories.

To model the rapid rise of the recorded Wivenhoe Dam levels between 03:00 to 15:00 on Tuesday 11 January 2011, the Mt Glorious rainfall data was repositioned to the ungauged area immediately upstream of the Dam where BoM radar indicated the centre of the heavy rainfall during that period. It was then necessary to scale this rainfall up by a factor of two to match the rapid lake level rises. This factored Mt Glorious rainfall data had an average intensity of 68mm/hr which exceeds an annual recurrence interval of 1 in 2,000 years and may be well into the extreme category. Rainfall of this intensity and duration over the Wivenhoe Dam Lake area at such a critical stage of a Flood Event was unprecedented. The resulting run-off could not be contained without transition to Strategy W4, as discussed in Section 2, and Section 10.0.

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

8.10 Wivenhoe Dam and Somerset Dam flood mitigation in Brisbane City

Seqwater's Unified River Basin Simulator (URBS) hydrologic model was used to assess the flood mitigation impact of Somerset and Wivenhoe Dams on flows and water levels at the Port Office gauge in Brisbane City. This hydrologic model consists of seven linked models representing various catchments within the Basin.

During the January 2011 Event, the model overestimated the heights and flows in the lower Brisbane River due to a lack of adequate flood plain storage along the mainstream. The model was adjusted to take into account this flood plain storage and recalibrated on several floods from January 1974 to January 2011, to satisfactorily reproduce recorded heights and estimated flows at gauging stations.

It should be noted that the behaviour of the Brisbane River downstream of Wivenhoe Dam is better simulated using a hydraulic model. However, in the absence of a fully calibrated hydraulic model and being limited by time constraints, the URBS hydrologic model has been used to enable relative comparison of various scenarios. The model was run under five cases as explained in the following Table 8.10.1.

Case number	Case description
1	Actual Wivenhoe Dam outflows combined with Lockyer Creek, Bremer River and other non-controlled catchment flows from the January 2011 Flood Event.
2	Lockyer Creek, Bremer River and other non-controlled catchment flows from the January 2011 Flood Event only.
3	Actual Wivenhoe Dam outflows from the January 2011 Flood Event only.
4	Assumes Wivenhoe Dam removed and uses estimated flows in the Brisbane River at the location of Wivenhoe Dam combined with Lockyer Creek, Bremer River and other non-controlled catchment flows from the January 2011 Flood Event. This case provides an indication of the impacts of the January 2011 Flood Event at Brisbane City if Wivenhoe Dam had not been constructed.
5	Assumes both Wivenhoe Dam and Somerset Dam removed and uses estimated flows in the Brisbane River at the location of Wivenhoe Dam combined with Lockyer Creek, Bremer River and other non-controlled catchment flows from the January 2011 Flood Event. This case provides an indication of the impacts of the January 2011 Flood Event at Brisbane City if both Wivenhoe Dam and Somerset Dam had not been constructed.

Table 8.10.1 – Comparison of modelled flood scenarios

For Case 4 and Case 5, the models containing the Dams were modified to remove the impervious fractions representing the reservoir areas. In addition, the reach length factors for the drowned reaches in the post Dam models were removed as appropriate for each case.

While the model does not replicate levels in the normal tidal ranges, it does replicate the higher flood stages under tidal conditions reasonably well. For all cases, the downstream tidal conditions recorded during the Event were adopted.

The results of the model runs containing these five cases are displayed in the following graphs, Figure 8.10.2 and Figure 8.10.3. Points not in relation to these results are:

- Inflows to the river system can not be directly added together due to the storage and routing impact of the flood plain and the river channels;
- The peak height at Brisbane City (Port Office gauge) generally coincides with the highest tide of the day, in the cases investigated;
- Even if the flood flows in the Stanley River and upper Brisbane River had been contained, and there were no releases from Wivenhoe Dam (Case 2), the flows from Lockyer Creek, Bremer River and other uncontrolled catchment flows would still have exceeded the threshold of urban damages;

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

- If there had not been any flows from Lockyer Creek, Bremer River and the other uncontrolled catchments, the actual releases from Wivenhoe Dam (Case 3) would have caused only minor flooding in Brisbane City;
- Without Wivenhoe Dam (Case 4), the peak flow would have been of the order of 12,000m³/s and the peak height would have been in the order of 2.0m higher at Brisbane City;
- Without Somerset and Wivenhoe Dams (Case 5), the peak flow would have been of the order of 14,000m³/s and the peak height would have been around 2.5m higher at the Port Office gauge.

Figure 8.10.2 - Impact of Somerset and Wivenhoe Dams at Brisbane Port Office, showing estimated flow

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

Figure 8.10.3 – Impact of Somerset and Wivenhoe Dams at Brisbane Port Office, showing peak height

The duration above selected thresholds was also extracted from the model runs as duration of flooding has an adverse impact on flood damages, with longer durations causing greater costs for the same peak flow.

The threshold of damaging floods in the lower Brisbane River is defined in the Flood Procedure Manual as $4,000\text{m}^3/\text{s}$, and this has been adopted for comparative purposes. The flow of $9,500\text{m}^3/\text{s}$ is the estimated peak flow of the January 2011 Flood Event at the Port Office gauge.

In Cases 4 and 5, the duration of flooding at the Port Office gauge would have been much longer than actually occurred. The duration above $4,000\text{m}^3/\text{s}$ is appreciably longer than recorded. However, the duration of the flow above the peak of the January 2011 Flood Event would have been much as two days longer.

Table 8.10.4 shows the duration of flooding above the selected threshold for the cases investigated.

Case	Duration above flow threshold (Hours)			
	4,000 m^3/s	6,000 m^3/s	8,000 m^3/s	9,500 m^3/s
Case 1 Existing	75	48	26	0
Case 2 No releases from Wivenhoe	35	12	0	0
Case 3 Wivenhoe releases only	24	0	0	0
Case 4 No Wivenhoe Dam	88	72	55	39
Case 5 No Wivenhoe Dam or Somerset Dam	87	75	61	51

Table 8.10.4 – Duration of flooding above the flow threshold

8 PRELIMINARY ASSESSMENT OF EVENT MAGNITUDE

8.11 Conclusion

Based on the information contained in this section, the following conclusions can be made in relation to the significance of the January 2011 Flood Event.

- The rainfall intensities varied significantly in the catchment areas above the Dams, although at some locations – especially around Wivenhoe Dam - the AEP of the short duration rainfalls may be classified as extreme;
- The AEPs for the Wivenhoe Dam average catchment rainfall were between the 1 in 100 and the 1 in 200 range for durations between 72 hours and 120 hours, clearly highlighting the significance of the Event;
- When compared with historical events, flood volumes indicate the volume of the January 2011 Event is almost double that of the January 1974 flood, and rivals the February 1893 flood;
- Peak water levels at gauging stations in the Brisbane River above Wivenhoe Dam were the highest on record. In the Lockyer Valley, peak water levels exceeded the 1974 levels and may well have been larger than those of 1893;
- Preliminary flood frequency analysis of records at Linville and Gregors Creek indicated there were two peaks of similar magnitude in the January 2011 Event at both Linville and Gregors Creek. Preliminary flood frequency analysis indicates the highest peak at both stations were significantly rarer than the generally accepted AEP of the 1974 flood of 1 in 75 (approaching 1 in 100). The probability of two such flood peaks within 36 hours of each other is considered to be appreciably uncommon and demonstrates the rarity of the January 2011 Flood Event;
- A comparison of the recorded peaks, volumes and peak levels at Somerset and Wivenhoe Dams indicate the January 2011 Flood Event easily exceeds 1 in 100 AEP;
- Below Wivenhoe Dam, the flood had an AEP similar to that of the post Wivenhoe 1974 flood and may be as high as 1 in 1,000;
- Overall, the January 2011 Flood Event is considered to represent a rare event as defined by Australian Rainfall and Run-off (AR&R) in terms of rainfall, flood peaks, inflow volume and peak heights.

9 DAM INFLOW AND FLOOD RELEASE DETAILS

9.1 Wivenhoe Dam

Table 9.1.1 provides full details of inflows into and releases from Wivenhoe Dam for the duration of the January 2011 Flood Event. Details of the strategies used in determining these releases and how these strategies comply with the Manual are contained in Sections 2 and 10 of this Report. Table 9.1.1 also shows that the gate operation sequence was in accordance with the Manual over the duration of the Event.

Some points to note in relation to the table in Table 9.1.1 are:

- Inflow and flood release calculations are based on manual gauge board readings shown in the table that provide the lake level. During the Event, these manual gauge board readings were provided by the Dam operators to the Flood Operations Centre on an hourly basis. Any missed readings have been interpolated from the closest available actual readings.
- Inflow calculations are based on the rate of change of the storage and use the Dam storage curve.
- Release calculations are based on the discharge rating tables contained in the Manual.
- The table shows inflow rates and releases on the hour through the event. In some instances, gate operations may have occurred between hours or at less than one-hourly intervals. In these instances, the table shows the actual gate openings as they were at the time indicated.
- The flood release from Wivenhoe Dam associated with the flood event prior to the January 2011 Flood Event was completed at 09:00 on 2 January 2011. The lake level in Wivenhoe Dam at this time was 67.10m or 0.15 metres below the gate opening trigger level. At this level, 16,250 ML of inflow is needed before trigger level is reached. Following gate closure, the Dam continued to release over 4,000 ML per day to account for base flow into the dam from the previous flood event, with the expectation being that the dam would slowly fall below FSL in the days following 2 January 2011. However due to

Table 9.1.1 - Wivenhoe Dam inflow and release data for the January 2011 Flood Event

A summary of the data in Table 9.1.1 is illustrated in Figure 9.1.2. The considerable flood mitigation benefits provided by Wivenhoe Dam over the duration of the Event is clearly demonstrated below.

9 DAM INFLOW AND FLOOD RELEASE DETAILS

DRAFT

Figure 9.1.2 -- Wivenhoe Dam inflow and release summary for the January 2011 Flood Event

9 DAM INFLOW AND FLOOD RELEASE DETAILS

9.2 Somerset Dam

Table 9.2.1 provides full details of inflows into and releases from Somerset Dam over the duration of the Flood Event. Details of the strategies used in determining these releases and how these strategies comply with the Manual are contained in Section 7 of this Report. Table 9.2.1 also shows the gate operation sequence was in accordance with the Manual over the duration of the Event.

Deleted: The following table in Figure

Deleted: Figure

Deleted: Figure

Some points to note in relation to the table in Table 9.2.1 are:

- Inflow and flood release calculations are based on manual gauge board readings shown in the table that provide the lake level. During the Event, these manual gauge board readings were normally provided by the Dam operators to the Flood Operations Centre on an hourly basis. However, with prior approval from the Flood Operations Centre, during non-critical periods, the operators occasionally would miss a reading to complete higher priority site activities. In these instances, the table value has been interpolated from the closest available actual readings.
- Inflow calculations are based on the rate of change of the storage and use the Dam storage curve.
- Release calculations use the discharge rating formulae contained in the Manual.
- The table shows inflow rates and releases on the hour through the event. In some instances, gate operations may have occurred between hours or at less than one-hourly intervals. In these instances, the table shows the actual gate openings as there were at the time indicated.

DRAFT ONLY - THIS IS

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

10.1 Wivenhoe Dam flood mitigation strategies

Wivenhoe Dam is capable of being operated in a number of ways to reduce flooding in the Brisbane River downstream of the Dam, depending on the origin, magnitude and spatial extent of the flood. Maximum overall flood mitigation effect is achieved by operating Wivenhoe Dam in conjunction with Somerset Dam.

There are four strategies (W1 to W4) used when operating Wivenhoe Dam during a flood event. These strategies are based on the Flood Objectives of the Manual. These objectives, listed in descending order of importance, are as follows:

- Ensure the structural safety of the Dams;
- Provide optimum protection of urbanised areas from inundation;
- Minimise disruption to rural life in the valleys of the Brisbane and Stanley Rivers;
- Retain the storage at Full Supply Level at the conclusion of the Flood Event;
- Minimise impacts to riparian flora and fauna during the drain down phase of the Flood Event.

When using any of the four strategies, consideration is always given to these objectives in this order, when making decisions on Dam releases.

The strategy chosen at any point in time depends on the actual levels in the Dams and the following predictions, which are to be made using the best forecast rainfall and stream flow information available at the time:

- Maximum storage levels in Wivenhoe and Somerset Dams;
- Peak flow rate at the Lowood Gauge (excluding Wivenhoe Dam releases);
- Peak flow rate at the Moggill Gauge (excluding Wivenhoe Dam releases).

Strategies change during a flood event as forecasts change and rain is received in the catchments. It is not possible to predict the range of strategies that will be used during the course of a flood event at the commencement of the event. Strategies are changed in response to changing rainfall forecasts and stream flow conditions to maximise the flood mitigation benefits of the Dams.

When determining Dam outflows within all strategies, peak outflow should generally not exceed peak inflow. A flowchart illustrating how to select the appropriate strategy to use at any point in time is shown in Figure 10.1.1.

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

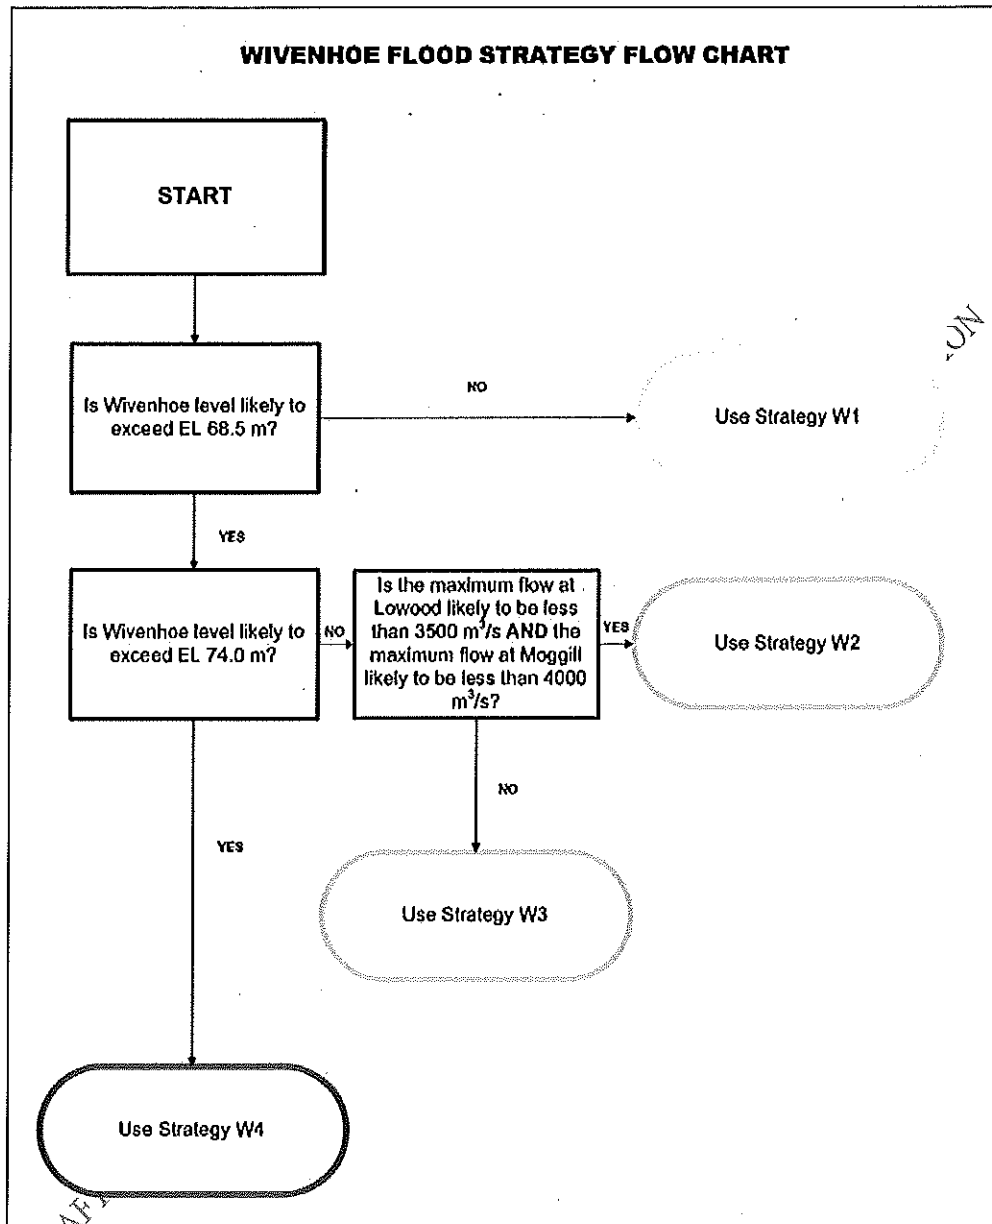

Figure 10.1.1 – Wivenhoe Dam flood strategy flow chart

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

The four Strategies (W1 to W4) used when operating Wivenhoe Dam during a flood event are summarised below.

Deleted: s

Strategy W1 - The primary consideration is minimising disruption to downstream rural life

- | | |
|-------------------|--|
| Conditions | <ul style="list-style-type: none"> Wivenhoe storage level predicted to be less than 68.50m Maximum release predicted to be less than 1,900m³/s The primary consideration is minimising disruption to downstream rural life |
|-------------------|--|

Strategy W1 intends to ensure the seven bridges between the Dam and Moggill are not submerged prematurely. The limiting condition for Strategy W1 is the submergence of Mt Crosby Weir Bridge that occurs at approximately 1,900 m³/s.

This strategy requires a great deal of control over releases and knowledge of discharges from Lockyer Creek. In general, the releases from Wivenhoe Dam are controlled to ensure the combined flow from Lockyer Creek and Wivenhoe Dam is less than the limiting values to delay the submergence of a particular bridge.

Strategy W2 - A transition strategy where the primary consideration changes from minimising impact to downstream rural life to protecting urban areas from inundation.

- | | |
|-------------------|--|
| Conditions | <ul style="list-style-type: none"> Wivenhoe storage level predicted to be between 68.50m and 74.00m Maximum release predicted to be less than 3,500m³/s This is a transition strategy in which the primary consideration changes from minimising disruption to downstream rural life to protecting urban areas from inundation Lower level objectives are still considered when making decisions on water releases. Objectives are always considered in order of importance |
|-------------------|--|

Strategy W2 intends to limit the flow in the Brisbane River to less than the naturally occurring peaks at Lowood and Moggill, while remaining within the upper limit of non-damaging floods at Lowood (3,500m³/s).

Strategy W3 - The primary consideration is protecting urban areas from inundation

- | | |
|-------------------|---|
| Conditions | <ul style="list-style-type: none"> Wivenhoe storage level predicted to be between 68.50m and 74.00m Maximum release should not exceed 4,000m³/s The primary consideration is protecting urban areas from inundation Lower level objectives are still considered when making decisions on water releases. Objectives are always considered in order of importance |
|-------------------|---|

Strategy W3 intends to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s, noting that 4,000m³/s at Moggill is the upper limit of non-damaging floods downstream. The combined peak river flow targets for Strategy W3 are shown in the table below. In relation to these targets, it should be noted that, depending on natural flows from the Lockyer and Bremer catchments, it may not be possible to limit the flow at Moggill to below 4,000m³/s. In these instances, the flow at Moggill is to be kept as low as possible.

Timing	Target maximum flow in the Brisbane River
Prior to the naturally occurring peak at Moggill (excluding Wivenhoe Dam releases).	The flow at Moggill is to be minimised.
After the naturally occurring peak at Moggill (excluding Wivenhoe Dam releases).	The flow at Moggill is to be lowered to 4,000m ³ /s as soon as possible.

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

Strategy W4 – The primary consideration is protecting the structural safety of the Dam

Conditions

- Wivenhoe storage level predicted to exceed 74.00m
- No limit on maximum release rate
- The primary consideration is protecting the structural safety of the Dam
- Lower level objectives are still considered when making decisions on water releases. Objectives are always considered in order of importance

Strategy W4 intends to ensure the safety of the Dam while limiting downstream impacts as much as possible. This strategy generally comes into effect when the water level in Wivenhoe Dam reaches 74.0m. However, the Senior Flood Operations Engineer may seek to invoke the discretionary powers of Section 2.8 if the earlier commencement of Strategy W4 is able to prevent a fuse plug being triggered.

Under Strategy W4, the release rate is increased as the safety of the Dam becomes the priority. The gates are generally opened until the storage level of Wivenhoe Dam begins to fall. There are no restrictions on gate opening increments or gate operating frequency once the storage level exceeds 74.0m, as the safety of the Dam is of primary concern at these storage levels.

10.2 Somerset Dam flood mitigation strategies

Somerset Dam is capable of being operated in a number of ways to regulate Stanley River floods. Somerset Dam and Wivenhoe Dam are to be operated in conjunction to optimise the flood mitigation benefits downstream of Wivenhoe Dam. Once a flood event is declared, an assessment is made of the magnitude of the flood event, including a prediction of the maximum storage levels in Somerset and Wivenhoe Dams.

Three strategies, based on the objectives of the Manual, are used when operating Somerset Dam during a flood event. The strategy selected at any point in time depends on predictions of the maximum storage levels in Somerset and Wivenhoe Dams, made using the best forecast rainfall and stream flow information available at the time.

Strategies are likely to change during a flood event as forecasts change and rain is received in the catchments. It is not possible to predict the range of strategies that will be used during the course of a flood event when the event begins. Strategies are changed in response to changing rainfall forecasts and stream flow conditions to maximise the flood mitigation benefits of the Dams.

A flowchart illustrating how to select the appropriate strategy to use at any point in time is shown in Figure 10.2.1.

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

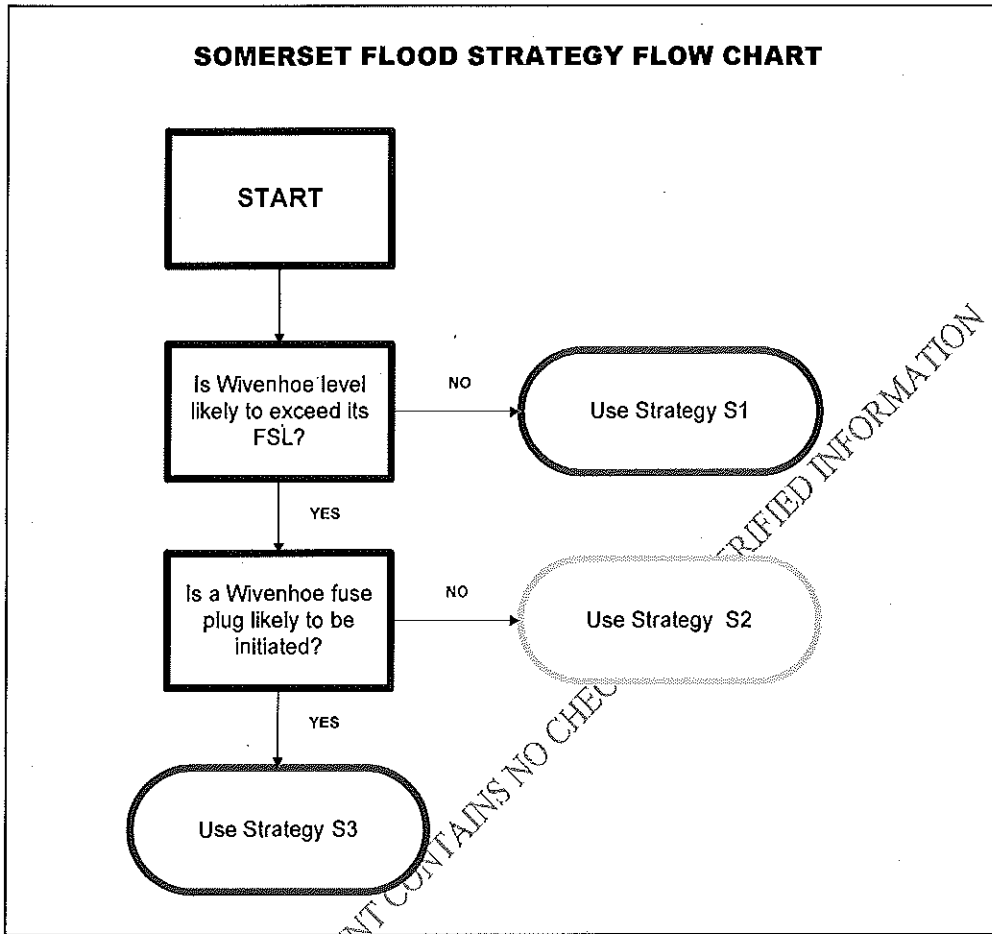

Figure 10.2.1 – Somerset Dam flood strategy flow chart

The three Strategies (S1 to S3) used when operating Somerset Dam during a flood event are summarised below.

Deleted: s

Strategy S1 – Minimising impact on rural life upstream

Conditions

- Somerset Dam level expected to exceed 99.0m and Wivenhoe Dam not expected to reach 67.0m (FSL) during the course of the flood event

Strategy S1 intends to return the Dam to full supply level while minimising the impact on rural life upstream of the Dam. Consideration is also given to minimising the downstream environmental impacts from the release.

The crest gates at Somerset Dam are raised to enable uncontrolled discharge. The regulator valves and sluice gates are to be used to maintain the level in Somerset Dam below 102.0m (deck level of Mary Smokes Bridge). The Somerset Dam release rate is not to exceed the peak inflow into the Dam.

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

Strategy S2 – Minimise impacts below Wivenhoe Dam

Conditions

- Somerset Dam level expected to exceed 99.0m and Wivenhoe Dam level expected to exceed 67.0m (FSL) but not exceed 75.5m (fuse plug initiation) during the course of the flood event

Strategy S2 intends to maximise the benefits of the flood storage capabilities of the Dam, while protecting the structural safety of both Dams. Table 10.2.2 contains the operating conditions and actions for Strategy S2.

Condition	Action
Wivenhoe Dam rising and Somerset level below 100.45m	<ul style="list-style-type: none"> • The crest gates are raised to enable uncontrolled discharge • The low-level regulators and sluices are generally kept closed
Wivenhoe Dam rising and Somerset level above 100.45m	<ul style="list-style-type: none"> • The crest gates are raised to enable uncontrolled discharge • Operations aim to achieve a correlation of water levels in Somerset Dam and Wivenhoe Dam, as set out in Figure 10.2.3. The operations target line shown on this graph is to generally be followed as the flood event progresses • The release rate from Somerset Dam is generally not to exceed the peak inflow into the Dam
Wivenhoe Dam falling and Somerset level above 100.45m	<ul style="list-style-type: none"> • The opening of the regulators and sluices generally should not cause Wivenhoe Dam to rise significantly • The release rate from Somerset Dam is generally not to exceed the peak inflow into the Dam
The flood event has emanated mainly from the Stanley River catchment without significant runoff in the Upper Brisbane River catchment	<ul style="list-style-type: none"> • The crest gates at Somerset Dam are raised to enable uncontrolled discharge • The regulator valves and sluice gates are to be used to maintain the level in Somerset Dam below EL 102.0 (deck level of Mary Smokes Bridge) <p>The release rate from Somerset Dam is generally not to exceed the peak inflow into the Dam.</p>

Table 10.2.2 – Somerset Dam operating conditions for flood strategy S2

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

Figure 10.2.3 Strategy S2, Wivenhoe / Somerset Operating Target Line

Notes on Figure 10.2.3:

- The Operating Target Line was selected following an optimisation study and considering the following factors:
 - Equal minimisation of flood level peaks in both Dams in relation to their associated Dam failure levels;
 - Minimisation of flows in the Brisbane River downstream of Wivenhoe Dam;
 - Consideration of the time needed at the onset of a flood event to properly assess the magnitude of the event and the likely impacts. This is to ensure the optimal strategy to maximise the flood mitigation benefits of the storages can be selected.
- The target point on the Operating Target Line at any point in time is based on the maximum storage levels in Somerset and Wivenhoe Dams, using the best forecast rainfall and stream flow information available at the time.
- Gate operations enable the progressive movement of the duty point towards the target line. It is not necessarily possible to adjust the duty point directly towards the target line in a single gate operation.

Strategy S3 - Protect the structural safety of the Dam

Conditions

- Somerset Dam level expected to exceed 99.0m and Wivenhoe Dam level expected to exceed 75.5m (fuse plug initiation) during the course of the flood event.

Strategy S3 intends to maximise the benefits of the flood storage capabilities of the Dam while protecting the structural safety of both Dams. In addition to the operating protocols used in Strategy S2 to prevent fuse plug initiation, consideration can be given to temporary departure from the operating protocols contained in this strategy under the following conditions:

- The safety of Somerset Dam is the primary consideration and cannot be compromised;
- The peak level in Somerset Dam cannot exceed 109.7m.

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

10.3 Wivenhoe Dam – Manual compliance

Table 10.3.1 summarises the strategies used in the operation of Wivenhoe Dam during the January 2011 Flood Event and provides explanations of how the use of these strategies complies with the Manual.

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

Period	Strategies used during the period	Explanation of strategies used during the period	Manual requirements
<p>Commenced Thursday 06 Jan 2011 07:42 (Lake level 67.31m)</p> <p>Completed Friday 07 Jan 2011 02:00 (Lake level 67.52m)</p>	Strategy W1A	<ul style="list-style-type: none"> At the start of the Event, Strategy W1A was used because the Lake level was between 67.25m and 67.50m. The strategy during this period was to ensure Colleges Crossing remained trafficable by limiting the combined flows from Wivenhoe Dam and Lockyer Creek to a maximum of 175m³/s. Because of the inflows into the Brisbane River from Lockyer Creek, there were no releases from the Dam during this period. Based on flows recorded at Mt Crosby Weir, Colleges Crossing remained trafficable during this period. The strategy transitioned from Strategy W1A to Strategy W1B once the Lake level exceeded 67.50m. 	<p>Use Strategy W1A when the Lake level is between 67.25m and 67.50m. [Maximum release 110m³/s]</p> <p>Under Strategy W1A, the Manual requirement is to endeavour to ensure Colleges Crossing remains trafficable by limiting the combined flows from Wivenhoe Dam and Lockyer Creek to a maximum of 175m³/s.</p> <p>Use Strategy W1B when the Lake level is between 67.50m and 67.75m. [Maximum release 380m³/s]</p>
<p>Commenced Friday 07 Jan 2011 02:00 (Lake level 67.52m)</p> <p>Completed Friday 07 Jan 2011 09:00 (Lake level 67.75m)</p>	Strategy W1B	<ul style="list-style-type: none"> The strategy transitioned from Strategy W1A to Strategy W1B once the Lake level exceeded 67.50m. Based on flows recorded at Mt Crosby Weir, Colleges Crossing was inundated during this period. The strategy during this period was to ensure Burtons Bridge remained trafficable by limiting the combined flows from Wivenhoe Dam and Lockyer Creek to a maximum of 430m³/s. Because of the inflows into the Brisbane River from Lockyer Creek, there were no releases from the Dam during this period. Based on flows recorded at Savages Crossing, Burtons Bridge remained trafficable during this period. The strategy transitioned from Strategy W1B to Strategy W1C once the Lake level exceeded 67.75m. 	<p>Use Strategy W1B when the Lake level is between 67.50m and 67.75m. [Maximum release 380m³/s]</p> <p>Under Strategy W1B, the Manual requires that once Colleges Crossing is closed to traffic, endeavour to ensure Burtons Bridge remains trafficable by limiting the combined flows from Wivenhoe Dam and Lockyer Creek to a maximum of 430m³/s.</p> <p>Use Strategy W1C when the Lake level is between 67.75m and 68.00m. [Maximum release 500m³/s]</p>

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

Period	Strategies used during the period	Explanation of strategies used during the period	Manual requirements
<p>Commenced Friday 07 Jan 2011 09:00 (Lake level 67.75m)</p> <p>Completed Friday 07 Jan 2011 15:00 (Lake level 68.03m)</p>	Strategy W1C	<ul style="list-style-type: none"> The strategy transitioned from Strategy W1B to Strategy W1C once the Lake level exceeded 67.75m. The strategy during this period was to ensure Burtons Bridge remained trafficable by limiting the combined flows from Wivenhoe Dam and Lockyer Creek to a maximum of 430m³/s. Once Burtons Bridge was closed to traffic, endeavour to keep Kholo Bridge trafficable by limiting the combined flows from Wivenhoe Dam and Lockyer Creek to a maximum of 550m³/s. Because of the inflows into the Brisbane River from Lockyer Creek, there were no releases from the Dam during this period. Based on flows recorded at Savages Crossing, Burtons Bridge was inundated near the end of this period. Based on flows recorded at Mt Crosby Weir, Kholo Bridge remained trafficable during this period. As well as being in accordance with the Manual, delaying releases until 15:00 allowed bridges to be closed by the relevant authorities and arrangements to be made to cater for rural community isolation. The impacted rural communities had been isolated over the Christmas period and time was needed to make suitable arrangements to allow these communities to prepare for another potentially extended isolation period. The strategy transitioned from Strategy W1C to Strategy W1D once the Lake level exceeded 68.00m. 	<p>Use Strategy W1C when the Lake level is between 67.75m and 68.00m. [Maximum release 500m³/s]</p> <p>Under Strategy W1C, the Manual requirement is to endeavour to keep Burtons Bridge trafficable by limiting the combined flows from Wivenhoe Dam and Lockyer Creek to a maximum of 430m³/s.</p> <p>Under Strategy W1C, the Manual also requires that once Burtons Bridge is closed to traffic (occurred around 13:00 during this period) endeavour to keep Kholo Bridge trafficable by limiting the combined flows from Wivenhoe Dam and Lockyer Creek to a maximum of 550m³/s.</p> <p>Use Strategy W1D when the Lake level is between 68.00m and 68.25m. [Maximum release 1,900m³/s].</p>

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

Period	Strategies used during the period	Explanation of strategies used during the period	Manual requirements
<p>Commenced Friday 07 Jan 2011 15:00 (Lake level 68.03m)</p> <p>Completed Friday 07 Jan 2011 22:00 (Lake level 68.26m)</p>	Strategy W1D	<ul style="list-style-type: none"> The strategy transitioned from Strategy W1C to Strategy W1D once the Lake level exceeded 68.00m. At the start of this period, it became apparent Kholo Bridge would be inundated by natural Brisbane River flows (excluding Wivenhoe Dam releases). Based on flows recorded at Mt Crosby Weir, Kholo Bridge was inundated near the end of this period (middle of the night). Therefore, the strategy adopted was to close Kholo Bridge in daylight hours for public safety and then assume – for the purposes of Strategy W1D – that Kholo Bridge was closed to traffic. Accordingly, the strategy during this period was to keep Mt Crosby Weir Bridge trafficable by limiting the combined flows from Wivenhoe Dam and Lockyer Creek to a maximum of 1,900m³/s. During this period, releases were increased to 421m³/s. Radial gates were opened continuously at Wivenhoe Dam, in accordance with the standard gate opening sequence at a rate of 0.5 metres of opening per hour. Mt Crosby Weir Bridge remained trafficable during the period. The strategy transitioned from Strategy W1D to Strategy W1E once the Lake level exceeded 68.25m. 	<p>Use Strategy W1D when the Lake level is between 68.00m and 68.25m. [Maximum release 1,900m³/s]</p> <p>Under Strategy W1D, the Manual requires that once Kholo Bridge is closed to traffic, endeavour to keep Mt Crosby Weir Bridge trafficable by limiting the combined flows from Wivenhoe Dam and Lockyer Creek to a maximum of 1,900m³/s.</p> <p>Use Strategy W1E when the Lake level is between 68.25m and 68.50m. [Maximum release 1,900 m³/s]</p>
<p>Commenced Friday 07 Jan 2011 22:00 (Lake level 68.26m)</p> <p>Completed Saturday 08 Jan 2011 08:00 (Lake level 68.26m)</p>	Strategy W1E	<ul style="list-style-type: none"> The strategy transitioned from Strategy W1D to Strategy W1E once the Lake level exceeded 68.25m. The strategy during this period was to keep Mt Crosby Weir Bridge trafficable by limiting the combined flows from Wivenhoe Dam and Lockyer Creek to a maximum of 1,900m³/s. During this period, releases were increased to 953m³/s. Radial gates were opened continuously at Wivenhoe Dam, in accordance with the standard gate opening sequence at a rate of 0.5 metres of opening per hour. Mt Crosby Weir Bridge remained trafficable during the period. The strategy transitioned from Strategy W1E to Strategy W2 once the Lake level reached 68.50m. 	<p>Use Strategy W1E when the Lake level is between 68.25m and 68.50m. [Maximum release 1,900m³/s]</p> <p>Under Strategy W1E, the Manual requirement is to endeavour to keep Mt Crosby Weir Bridge trafficable by limiting the combined flows from Wivenhoe Dam and Lockyer Creek to a maximum of 1,900m³/s.</p> <p>Use Strategy W2 or Strategy W3 as appropriate when the Lake level reaches 68.50m.</p>

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

Period	Strategies used during the period	Explanation of strategies used during the period	Manual requirements
Saturday 08 Jan 2011 08:00 (Lake level 68.52m)	Attempt to transition to Strategy W2	<ul style="list-style-type: none"> The Lake level at this time was 68.52m and the release rate from the Dam at this time was 940m³/s. At this time, it was not possible to satisfy Strategy W2 by limiting the flow in the Brisbane River to less than the naturally occurring peaks at Lowood and Moggill. The calculated naturally occurring peaks at Lowood and Moggill were 530m³/s and 800m³/s respectively, whereas the release rate from the Dam at this time was 940m³/s. Accordingly, it was not appropriate to switch to Strategy W2, and Strategy W3 was adopted for use at 08:00 on Saturday 8 January 2011. 	<p>The Manual states, "If the level reaches EL 68.5m in Wivenhoe Dam, switch to Strategy W2 or W3 as appropriate".</p> <p>Use Strategy W2 when the Lake level is predicted to be between 68.50m and 74.00m. [Maximum release 3,500m³/s]</p> <p>Strategy W2 is a transition strategy in which the primary consideration changes from minimising disruption to downstream rural life to protecting urban areas from inundation.</p> <p>Lower level objectives are still considered under Strategy W2 when making decisions on water releases. Objectives are always considered in order of importance.</p> <p>The intent of Strategy W2 is to limit the flow in the Brisbane River to less than the naturally occurring peaks at Lowood and Moggill, while remaining within the upper limit of non-damaging floods at Lowood (3,500m³/s).</p>

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHECKED OR VERIFIED INFORMATION

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

Period	Strategies used during the period	Explanation of strategies used during the period	Manual requirements
<p>Commenced Saturday 08 Jan 2011 08:00 (Lake level 68.52m)</p> <p>Completed Sunday 09 Jan 2011 08:00 (Lake level 68.58m)</p>	<p>Strategy W3</p>	<ul style="list-style-type: none"> The Lake level at the start of this period was 68.52m and the release rate from the Dam was 940m³/s. The Lake level at the end of this period was 68.58m and the release rate from the Dam was 1,386m³/s. The Lake level rose 60mm during this 24-hour period. The catchment average rainfall experienced in the Wivenhoe Dam catchment (excluding the Somerset Dam catchment) during this 24-hour period was 21mm. The latest QPF forecast available at the end of this period was for 40mm in the Dam catchments in the next 24 hours (issued at 16:00 on 8 January 2011). At the end of this period, model results estimated the Wivenhoe Dam peak at 68.7m (excluding forecast) and 69.3m (including forecast). The estimated peak of 69.3m (including forecast) had previously been exceeded in March 1989, April 1989, February 1999, October 2010 and December 2010. On each of these occasions, no known urban damage had occurred downstream of Moggill as a result of Dam releases. At the end of this period, model results estimate total Dam inflow at 420,000ML (excluding forecast) and 662,000ML (including forecast). The estimated total Dam inflow of 662,000ML (including forecast) on a full Dam had previously been exceeded in March 1989, April 1989 and February 1999. On each of these occasions, no known urban damage had occurred downstream of Moggill as a result of Dam releases. Estimated peak flow at Moggill (including Wivenhoe Dam releases) was 1,720m³/s (excluding forecast) and 2,220m³/s (including forecast). On the basis of the information above, the available data did not indicate there would be a need to increase releases from Wivenhoe Dam above the current modelled levels to protect urban areas from inundation, either during the current period or in the 24 hours following the current period. The naturally occurring peak at Moggill was estimated to have occurred at 05:00 on 08 January 2011 (i.e. in the past). Strategy W3 requires the flow at Moggill to be lowered to 4,000m³/s as soon as possible after the naturally occurring peak at Moggill (excluding Wivenhoe Dam releases). This was already achieved. Strategy W3 also requires consideration of lower level Manual objectives, and on the basis of this requirement, consideration during this period was given to minimising disruption to downstream rural life and endeavouring to keep Mt Crosby Weir Bridge and Fernvale Bridge trafficable. 	<p>Use Strategy W3 when the intent of Strategy W2 cannot be met and the Lake level is predicted to be between 68.50m and 74.00m. [Maximum release 4,000m³/s]</p> <p>The primary consideration is protecting urban areas from inundation, however the Manual also requires lower level objectives to be considered when making decisions on water releases. Objectives are always considered in order of importance.</p> <p>The intent of Strategy W3 is to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s.</p> <p>After the naturally occurring peak at Moggill (excluding Wivenhoe Dam releases), the flow at Moggill is to be lowered to 4,000 m³/s as soon as possible.</p>

DRAFT

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

Period	Strategies used during the period	Explanation of strategies used during the period	Manual requirements
<p>Commenced Sunday 09 Jan 2011 08:00 (Lake level 68.58m)</p> <p>Completed Sunday 09 Jan 2011 19:00 (Lake level 68.97m)</p>	Strategy W3	<ul style="list-style-type: none"> The Lake level at the start of this period was 68.58m and the release rate from the Dam was 1,386m³/s. The Lake level at the end of this period was 68.97m and the release rate from the Dam was 1,411m³/s. The Lake level rose 390mm during this 11-hour period. The catchment average rainfall experienced in the Wivenhoe Dam catchment (excluding the Somerset Dam catchment) during this 24-hour period was 96mm, the bulk of which (62mm) occurred in the last five hours of the period. The latest QPF forecast available at the end of this period was for 65mm in the Dam catchments in the next 24 hours (issued at 16:00 on 9 January 2011). At the mid-point of this period (14:00), model results estimated Wivenhoe Dam to peak at 70.0m (excluding forecast) and 71.3m (including forecast). The estimated peak of 71.3m (including forecast) had previously been exceeded in April 1989, and on this occasion, no known urban damage had occurred downstream of Moggill as a result of Dam releases. At the mid-point of this period (14:00), model results estimated total Dam inflow at 804,000ML (excluding forecast) and 1,108,000ML (including forecast). The estimated total Dam inflow of 1,108,000ML (including forecast) – on a full Dam – had never previously been exceeded, with the previous largest volumes being 870,000ML in April 1989 and 925,000 in February 1999. Although the inflow estimate of 1,108,000ML was based on a forecast, it resulted in an expectation that there may be a need within the next six hours to transition to a situation where minimising disruption to downstream rural life was no longer considered. This would result in the closure of all bridges between the Dam and Moggill, and the closure of Brisbane Valley Highway. At the mid-point of this period (14:00), estimated peak flow at Moggill (including Wivenhoe Dam releases) was 1,850m³/s (excluding forecast) and 2,590m³/s (including forecast). On the basis of the information above, the available data at the mid-point of this period did not indicate there would be a definite need to increase releases from Wivenhoe Dam above the current modelled levels, to protect urban areas from inundation in the six hours from 14:00. At the end of this period, model results estimated Wivenhoe Dam to peak at 72.1m (excluding forecast) and 73.9m (including forecast). These values had never been previously exceeded. At the end of this period, model results estimated total Dam inflow at 1,272,000ML (excluding forecast) and 1,712,000ML (including forecast). These values had never been previously exceeded. On the basis of the estimated Wivenhoe Dam peak levels and inflow volumes from the model results undertaken towards the end of this period, the decision was made at 19:00 on 09 January 2011 to transition to a situation where minimising disruption to downstream rural life was no longer a consideration. 	<p>Use Strategy W3 when the intent of Strategy 2 cannot be met and the Lake level is predicted to be between 68.50m and 74.00m. [Maximum release 4,000m³/s]</p> <p>The primary consideration is protecting urban areas from inundation, however the Manual also requires lower level objectives to be considered when making decisions on water releases. Objectives are always considered in order of importance.</p> <p>The intent of Strategy W3 is to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s.</p> <p>After the naturally occurring peak at Moggill (excluding Wivenhoe Dam releases), the flow at Moggill is to be lowered to 4,000m³/s as soon as possible.</p>

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

Period	Strategies used during the period	Explanation of strategies used during the period	Manual requirements
<p>Commenced Sunday 09 Jan 2011 19:00 (Lake level 68.97m)</p> <p>Completed Tuesday 11 Jan 2011 08:00 (Lake level 73.70m)</p>	Strategy W3	<ul style="list-style-type: none"> On the basis of the information contained in the previous table, at the start of this period, it was decided to transition to a situation where minimising disruption to downstream rural life was no longer considered. The Lake level at the start of this period was 68.97m and the release rate from the Dam was 1,411m³/s. The Lake level at the end of this period was 73.70m and the release rate from the Dam was 2,753 m³/s. The Lake level rose 4,730mm during this 37-hour period. The catchment average rainfall experienced in the Wivenhoe Dam catchment (excluding Somerset Dam catchment) during this 24-hour period was 115mm, the bulk of which (77mm) occurred in the last twelve hours of this 37-hour period. The latest QPF forecast available at the end of this period was for 65mm in the Dam catchments in the next 24 hours (issued at 16:00 on 10 January 2011). By two thirds of the way through this period (20:00 on 10 January 2011), model results estimated Wivenhoe Dam to peak at 73.6m (excluding forecast) and 74.3m (including forecast). A discussion with the Dam Safety Regulator was held at 21:00 to obtain permission to exceed a level of 74.0m in Wivenhoe Dam for a short period without invoking Strategy W4 (provided the safety of the Dam could be guaranteed). This issue was considered carefully at all times during the period in view of the continued rainfall. At 04:00 on 11 January 2011, a period of intense rainfall commenced within the Wivenhoe Dam catchment area. By 08:00, model results estimated Wivenhoe Dam would peak at 74.5m (excluding forecast) and 75.1m (including forecast). A decision was made to transition to Strategy W4 and the Dam Safety Regulator, Seqwater CEO and the Councils were advised of this decision. The Wivenhoe Lake level was 73.70m. 	<p>Use Strategy W3 when the intent of Strategy 2 cannot be met and the Lake level is predicted to be between 68.50m and 74.00m. [Maximum release 4,000m³/s]</p> <p>The primary consideration is protecting urban areas from inundation, however the Manual also requires lower level objectives to still be considered when making decisions on water releases. Objectives are always considered in order of importance.</p> <p>The intent of Strategy W3 is to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s.</p> <p>After the naturally occurring peak at Moggill (excluding Wivenhoe Dam releases), the flow at Moggill is to be lowered to 4,000m³/s as soon as possible.</p> <p>Use Strategy W4 when Wivenhoe Dam's storage level is likely to exceed 74.00m. [No limit on maximum release rate]</p> <p>The primary consideration of Strategy W4 is to protect the structural safety of the Dam, however lower level objectives are still considered in order of importance when making decisions on water releases.</p> <p>Under Strategy W4, gates are opened until the storage level of Wivenhoe Dam begins to fall.</p>

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

Period	Strategies used during the period	Explanation of strategies used during the period	Manual requirements
<p>Commenced Tuesday 11 Jan 2011 08:00 (Lake level 73.70m)</p> <p>Completed Thursday 13 Jan 2011 12:00 (Lake level 74.61m)</p>	Strategy W4	<ul style="list-style-type: none"> On the basis of the information contained in the previous table, at the start of this period it was decided to transition to Strategy W4. The Lake level at the start of this period was 73.70m and the release rate from the Dam was 2,753m³/s. The Lake level at the end of this period was 74.61m and the release rate from the Dam was 2,534m³/s. During this period, at 19:00 on 11 January 2011, the Lake level peaked at 74.97m and the release rate peaked at 7,464m³/s. The Lake level stabilised at 20:00 on 11 January 2011 and then dropped slightly at 21:00. A decision was made at 21:00 to commence closing the gates as quickly as possible to reduce urban flood impacts. This decision was made in an attempt to minimise urban damage below Moggill, which is an objective that must be considered under Strategy W4. Gates would have been re-opened if further Lake level rises were experienced. Following a decision to close the gates, it was calculated that reducing to a discharge of 2,547m³/s from Wivenhoe Dam would: <ul style="list-style-type: none"> Not increase the downstream flood peak; Not cause the water level in Wivenhoe Dam to rise; and Allow the dam to be drained back to FSL in seven days in accordance with the Manual. On this basis, this target release rate was adopted. At the end of this period, it was apparent the flood peak had passed and therefore the operational strategy transitioned to the drain down phase 	<p>Use Strategy W4 when Wivenhoe Dam's storage level is likely to exceed 74.00m. [No limit on maximum release rate]</p> <p>The primary consideration of Strategy W4 is to protect the structural safety of the Dam, however lower level objectives are still considered in order of importance when making decisions on water releases.</p> <p>Under Strategy W4, gates are opened until the storage level of Wivenhoe Dam begins to fall.</p> <p>Drain down operations require stored floodwaters to be emptied from the Dams within seven days of the flood event peak passing through the Dams.</p>

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

Period	Strategies used during the period	Explanation of strategies used during the period	Manual requirements
<p>Commenced Thursday 13 Jan 2011 08:00 (Lake level 74.61m)</p> <p>Completed Wednesday 19 Jan 2011 12:00 (Lake level 66.89m)</p>	Drain down	<ul style="list-style-type: none"> On the basis of the information contained in the previous table, a decision was made at the start of this period to transition to the drain down phase. The Lake level at the start of this period was 74.61m and the release rate from the Dam was 2,534 m³/s. The Lake level at the end of this period was 66.89m and only operational water supply releases were being made from the Dam. Considerations that impacted the duration and timing of the drain down phase in this instance included: <ul style="list-style-type: none"> Causing no additional increases in river levels below the Dam (except where they were unavoidable due to tidal influences); Maintaining an adequate release rate to ensure the temporary pumps providing water supplies to the Lowood area could continue to operate; Minimising bank slumping impacts along the river, particularly in key areas such as Coronation Drive (as requested by Brisbane City Council); Re-opening Brisbane Valley Highway, the D'Agular Highway and key rural bridges as quickly as possible; Achieving Full Supply Levels in the Dams at the conclusion of the Event. The Flood Event concluded on Wednesday 19 January 2011 at 12:00. 	Drain down operations require stored floodwaters to be emptied from the Dams within seven days of the flood event peak passing through the Dams.

Table 10.3.1 – Wivenhoe Dam operating strategies for the January 2011 Flood Event, in compliance with the Manual

DRAFT ONLY - THIS DOCUMENT CONTAINS DRAFT INFORMATION

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

10.4 Somerset Dam – Manual compliance

The table that commences on the following page (Table 10.4.2) summarises the strategies used to operate Wivenhoe Dam during the January 2011 Flood Event, and outlines how the use of these strategies complies with the Manual.

A graph showing the track of the Wivenhoe / Somerset Operating Target Line over the course of the Event is shown at the end of the Table 10.4.3. The Dam levels tracked very close to and on the line, in the hours leading up to and following the Event peak at 19:00 on 11 January 2011. This is demonstrated in Table 10.4.1.

Date	Actual Dam level coordinates		Interaction line coordinates		Comments
10/01/2011 23:00	103.39	73.22	103.39	73.18	Moved above interaction line.

Considerations that impacted on the duration and timing of the drain down phase in this instance included: <ul style="list-style-type: none"> Causing no renewed increases in the Wivenhoe Dam Lake level; Re-opening D'Aguilar Highway and other impacted rural bridges as quickly as possible; Achieving Full Supply Levels in the Dams at the conclusion of the Event. The Flood Event was concluded on Wednesday 19 January 2011 at 12:00. 	<p>Drain down operations require stored floodwaters to be emptied from the Dams within seven days of the flood event peak passing through the Dams.</p>

Table 10.4.2 – Somerset Dam operating strategies for the January 2011 Flood Event, in compliance with the Manual

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

Figure 10.4.3 – Wivenhoe / Somerset Operating Target Line throughout the January 2011 Flood Event

11 EVENT COMMUNICATION

Queensland's disaster management response is provided at a local, district and State level by various, specialist agencies. This collaborative approach ensures the effective and timely coordination of information and support services state-wide.

Disaster management and hazard-specific response plans provide details of arrangements and processes to be followed at times of crisis and identify the need for all public communication to be coordinated during these critical times.

Following the flood event impacting Somerset and Wivenhoe Dams in October 2010, a Communication Protocol was developed to ensure the effective communication between local, State and Commonwealth agencies impacted by the release of floodwater from the Dams. In summary, this Protocol outlines the communication processes to be followed during flood events by the following agencies:

- Brisbane City Council;
- Ipswich City Council;
- Somerset Regional Council;
- Seqwater;
- Water Grid Manager;
- Queensland Police Service;
- Department of Community Safety;
- Department of Environment and Resource Management;
- Department of Premier and Cabinet;
- Bureau of Meteorology.

The Communication Protocol is designed to ensure consistent, harmonised information is effectively communicated to the public based on an agreed single technical report. The information in this report is used to inform communities and assist them to make decisions in the interests of public safety.

The Protocol divides the communication process into three key stages:

1. Monitoring and assessment;
2. Briefing and activation;
3. Public communications.

The application of this Communication Protocol to the January 2011 Flood Event is summarised below.

1. Monitoring and assessment

During the January 2011 Event, all flood information communicated to the public - including information about floodwater releases from Wivenhoe Dam - was based upon a continuous process of monitoring and technical assessment of the developing situation. This process is dynamic and evolves according to the event however, it generally follows a standard set of steps, as outlined below. During the January 2011 Event, the following monitoring and assessment steps were undertaken:

- Weather events and Dam levels were routinely monitored by relevant agencies via established systems and procedures.
- The Bureau of Meteorology (BoM) was the primary agency responsible for providing weather forecasts and warnings to the public.
- Councils monitored creek levels, local runoff and flash flooding within their areas of responsibility.
- Seqwater modelled implications of the inflows on the necessary floodwater release from Somerset Dam and/or Wivenhoe Dam. (The floodwater release strategy is a balance between releasing the water quickly

11 EVENT COMMUNICATION

enough so the flood storage capacity is available if another major rain event occurs, and minimising downstream flooding impacts to people and property from the releases.)

- Seqwater calculated floodwater releases according to the Manual and provided this information to BoM and the Councils. BoM modelled the Brisbane River catchment and its river systems using this information.
- BoM participated in technical discussions with Seqwater, Brisbane City Council, Ipswich City Council and Somerset Regional Council as necessary, to share modelling results. These discussions lead to the development of a technical agreement around the flood situation, upon which public communications were based.
- Councils with the necessary resources and expertise undertook modelling, formed predictions, identified flood inundation areas and assessed impacts for their communities and shared this information with relevant parties. Councils without the necessary resources and expertise had to rely on information from other agencies to complete the impact assessment for their communities.

The Communication Protocol allows each agency to initiate public communication and engage disaster management processes as they deem appropriate. The trigger points for initiating the public communication of flood event information are defined according to an agency's responsibilities.

During the January 2011 Flood Event, local, State and Commonwealth agencies increased their frequency of communication with the community as it became apparent public impacts were likely.

Technical staff from relevant agencies held regular teleconferences to clarify and agree modelling inputs and results. In particular, regular teleconferences were held between Seqwater and BoM.

A Technical Situation Report (TSR) around the floodwater release from Wivenhoe Dam was also completed by Seqwater and provided to the Water Grid Manager and relevant local government agencies, in line with the requirements of Seqwater's Emergency Response Plan. The frequency of these reports was increased as critical periods were experienced during the Event. Appendix F contains a copy of all Technical Situation Reports issued during the Event.

2. Briefing and activation

During a flood event, if public safety is considered to be at risk, disaster management arrangements may be activated. During the January 2011 Flood Event, the following briefings were undertaken:

- The Brisbane City, Ipswich City and Somerset Regional Councils activated their Local Disaster Management Groups (LDMGs);
 - LDMGs informed the relevant District Disaster Coordinators of the situation;
 - The Queensland Police Service (QPS) initiated disaster management actions as provided for under the *Disaster Management Act 2003*;
 - The Water Grid Manager alerted the Director-General (DG) of the Department of Community Safety (DCS), the DG of the Department of Environment and Resource Management (DERM), and the Brisbane City, Ipswich City and Somerset Regional Councils;
- The DG of the DCS informed the DG of the Department of Premier and Cabinet (DPC), the Chair of the State Disaster Management Group (SDMG) and activated the State Disaster Coordination Centre (SDCC). The DG DCS also informed the Minister for Police, Corrective Services and Emergency Services;
- The DG DERM informed the Minister for Natural Resources, Mines and Energy;
 - The DG DPC informed the Premier;
- The Crisis Communications Network, chaired by DPC, was activated at the direction of the SDMG Chair to coordinate public messaging from BoM, Seqwater, the Water Grid Manager, QPS, relevant Councils and the DCS.

11 EVENT COMMUNICATION

3. Public communications issues

The Communication Protocol developed following the October 2010 Flood Event states that each agency is responsible for publicly communicating information commensurate with their role. This can be done without prior approvals. However, during the January 2011 Flood Event, agencies shared information and operated in a fully consultative process to ensure consistent public information was provided.

The BoM, local governments and relevant State government agencies remained in frequent contact to ensure conflicting information was not released at any time during the Event. Agencies also ensured this consultation process did not cause delays in providing necessary public warnings. To ensure communication accuracy, all information provided to the public was based on information contained in technical reports.

The following agencies were responsible for the communication of specific information during the Event:

- **Bureau of Meteorology** – Concentrated on flood warnings, which were communicated broadly via the BoM website (www.bom.gov.au), other agencies and the media. Representatives from BoM also participated in media (radio, television, newspaper) interviews to provide factual information regarding observed and forecast weather conditions, rainfalls and water levels.
- **Local Governments / Local Disaster Management Groups** – Communicated the effects of weather-related events and the impact on safety for their local communities, residents, and Councils' assets. Local governments had the primary responsibility for communication within their community.
- **Water Grid Manager** – As the State's lead communication agency on floodwater release, the Water Grid Manager concentrated on publicly communicating aspects of release timings and the expected duration of the impacts. To allow these communications to occur, Seqwater operational staff ensured the supporting technical information was provided to the Water Grid Manager. The Water Grid Manager took responsibility for liaising with local government and coordinating any public communications in relation to the flood releases.
- **Seqwater** – Situation updates were provided to the Water Grid Manager, Brisbane City Council, Ipswich City Council and Somerset Regional Council on a regular basis. In addition to these operational communications, Seqwater also provided regular updates to mid-Brisbane irrigators during the event. These updates were also provided to the Water Grid Manager.

These primary communications were augmented by:

- **Queensland Police Service** – Provided specific community safety messaging during operations.
- **Department of Community Safety** – Communicated general safety matters regarding flooding.
- **Department of Premier and Cabinet (extreme events only)** – Ensured consistent messages were provided to the media and other relevant agencies.

Information was released to the public as frequently as required throughout the Event. The timing of media releases was guided by the frequency of technical reports, which ranged from once a day to once an hour during critical stages of the Event.

The Water Grid Manager's Communications Unit centrally tracked and shared all communications and liaised with the following agencies in regard to public safety messages:

- BoM;
- Seqwater;
- Councils' Media Directors;
- QPS Media Director;
- DCS Media Director.

Overall, it appears public and agency communications throughout the Event was effective and inline with the Communication Protocol developed following the October 2010 Flood Event.

12 REVIEW OF DATA COLLECTION SYSTEMS

12.1 Review of data collection system performance during the Event

The rainfall and stream height field stations had never been tested by a flood the size of the January 2011 Event. As would be expected in all systems of this type world-wide, some field failures did occur during the Event. Some stations were completely destroyed by the flood flows. By surveying the aftermath of the flood and its impacts along the river channels, it is easy to see how this occurred.

After the Event, 14 out of 75 rain stations, and 31 out of 71 river height stations, were not operating correctly. This is considered a good result, with the station redundancy system Seqwater has in place within the network mitigating the impacts of these failures. There were no data omissions or errors resulting from these failures which resulted in incorrect operational decisions being made. This issue is examined in Section 5.0.

One significant gap in rainfall data occurred on Tuesday 11 January 2011 during the period of intense rainfall that resulted in extreme and rapid rises in the level of Wivenhoe Dam. This very intense rainfall appeared to fall directly on the Wivenhoe Dam lake, outside the catchment rain gauges. This was a similar scenario to when the rainfall that led to the flash flooding in Lockyer Valley occurred the previous day. This flash flooding impacted the Grantham township however, the catchment rain gauges did not record the extreme rainfall.

A solution to this issue could be to install additional rain gauges in the Brisbane Basin (a detailed examination of this issue will be undertaken in conjunction with BoM and other relevant agencies as soon as practical). However, within an area the size of the Brisbane Basin, it is not practically possible to guarantee any rain gauge network will detect all instances of very intense or extreme rainfall that could occur in the Basin area.

Deleted: 1

12.2 Future of the data collection system

The current ALERT data collection network has been operational since 1995. Overall the performance of the system in recent times has been satisfactory, with the following improvements made in recent times:

- Seqwater employed a dedicated hydrographic team to enhance and maintain the data collection network. This team continues to be supported by the RoadTek technicians who have been maintaining the network since its initial installation.
- In 2008/09, around 30 stations were upgraded with new generation ALERT Event Reporting Radio Telemetry System (ERRTS) equipment. In 2009/10, a further 55 sites were upgraded so now almost all the ERRTS equipment in the Seqwater ALERT network has now been upgraded.
- In 2008/09 and 2009/10, new rainfall stations were constructed and installed at the following locations:
 - Lindfield;
 - Westvale;
 - Hazeldean;
 - Monsildale;
 - Mt Stanley;
 - Mt Bonga;
 - Blackbutt;
 - Redbank Creek.
- In 2008/09 and 2009/10, new rain/river height stations were constructed and installed at the following locations:
 - Atkinson Dam;
 - Bill Gunn Dam;
 - Lake Clarendon Dam;
 - Moogerah Dam;
 - North Pine River at Dayboro Waste Water Treatment Plant.
- In 2008/09 and 2009/10, new river height stations were installed at the following locations:
 - Kilcoy Creek downstream of Kilcoy Weir;
 - Kobbie Creek at Mt Samson.

12 REVIEW OF DATA COLLECTION SYSTEMS

The network will undergo further upgrades and enhancements over the coming years as Seqwater looks to maximise the system's overall reliability.

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHECKED OR VERIFIED INFORMATION

13 REVIEW OF FLOOD OPERATIONS CENTRE MOBILISATION AND STAFFING

13.1 Duty Engineers

The four Duty Engineers approved by the Chief Executive Officer to direct the operations of Somerset and Wivenhoe Dams during flood events are:

1. Engineer 1;
2. Engineer 2;
3. Engineer 3;
4. Engineer 4.

Engineer 1, Engineer 2 and Engineer 3 are three of the most experienced and expert Engineers in the industry in relation to their knowledge of Brisbane River flood hydrology. Engineer 4 is probably the most experienced engineer in Queensland in relation to the operation and maintenance of gated dams. Resumes for these engineers are contained in Appendix N.

During the Event, the Duty Engineers worked long hours and functioned on a limited amount of sleep, particularly during the critical period of the Event between Sunday 9 January 2011 and Wednesday 12 January 2011. While these demands are expected with this work, decision making was not adversely impacted in any way during the Event. However, it is recommended the following support mechanisms are examined to determine any valuable improvements to the current system.

Number of Duty Engineers

The appropriate number of Duty Engineers required to work during an event has been widely considered and discussed over the past 15 years. From the perspective of event management continuity and coordination, a small team of very expert and experienced staff working closely together is preferred. However, this must be considered in line with the potential impact of fatigue during larger events or extended periods of operation.

From 1996 to date, engaging four Duty Engineers has proven to be effective when managing flood events impacting the Dams. There are currently also three professionally qualified engineers working within the flood officer team who gain valuable event experience that will eventually enable them to transition to the Duty Engineer role should this be deemed appropriate.

Factors that could assist in managing fatigue, and that will be examined further in conjunction with the Dam Safety Regulator at an appropriate time following the submission of this Report, are:

- The requirement to have a Duty Engineer present in the Flood Operations Centre on a 24/7 basis, during dam drain down periods when there is no rain falling or forecast and gate movements are not undertaken;
- The provision of appropriate accommodation facilities close to the Flood Operations Centre to allow effective rest and sleep when staff are required at the Centre on a 24/7 basis.

Work hours

While the work hours during the Event were long, they were not considered excessive or to be at a level that adversely impacted operational decision making. Natural disaster emergency management requires efforts above and beyond normal day-to-day operations, and the Duty Engineers fully accept and understand this is a responsibility of the position.

13 REVIEW OF FLOOD OPERATIONS CENTRE MOBILISATION AND STAFFING

13.2 Flood Officers

The nine Flood Officers that assisted in the Flood Operations Centre during the Event were:

1. Flood Officer 1;
2. Flood Officer 2;
3. Flood Officer 3;
4. Flood Officer 4;
5. Flood Officer 5;
6. Flood Officer 6;
7. Flood Officer 7;
8. Flood Officer 8;
9. Flood Officer 9.

All Officers have been trained in Flood Operations Centre duties and completed their allocated tasks efficiently, correctly and with a high degree of professionalism over the full duration of the Event.

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHECKED OR VERIFIED INFORMATION

14 REVIEW OF DAM SITE MOBILISATION AND STAFFING

Deleted: thirteen

The 13 Dam Operators that operated Somerset and Wivenhoe Dams during the Event were:

1. Dam Operator 1;
2. Dam Operator 2;
3. Dam Operator 3;
4. Dam Operator 4;
5. Dam Operator 5;
6. Dam Operator 6;
7. Dam Operator 7;
8. Dam Operator 8;
9. Dam Operator 9;
10. Dam Operator 10;
11. Dam Operator 11;
12. Dam Operator 12;
13. Dam Operator 13.

All Operators have been trained in Flood Operations Centre duties and all completed their allocated tasks efficiently, correctly and with a high degree of professionalism over the duration of the Event.

The following is a list of suggestions that will help to ensure the Dam Operators are fully supported and can continue to perform their roles with a high level of effectiveness in future events:

- Staff housing arrangements should be retained. Having trained operators living on site is critically important during extreme events of this nature to ensure the timely response to developing situations;
- Local staff members working on site during flood events need to be able to maintain contact with their family and friends to provide reassurance they are safe and secure while on duty. This is an issue that may have caused some anxiety at certain stages of the January 2011 Event and will be addressed;
- Ensuring additional electrical and mechanical trade support can be provided to the Dams during events of this nature. While there were no equipment breakdowns during this Flood Event, and while multi-level operational back-up systems are provided to release flood water if breakdowns do occur, trade support may be critically important if breakdowns do occur. Unless trade support can be sourced prior to the closure of Brisbane Valley Highway, the Dams may not be accessible in extreme events as travel to the Dams becomes difficult and at times, impossible. The ability to ensure early in the event that trade support is accessible should be examined.

15 REVIEW OF FLOOD MODELLING SYSTEMS

15.1 Review of system performance during the Event

The Real Time Flood Model (RTFM) and associated systems performed well during the Event as described in detail in Section 8. No system failures occurred during the Event and, generally, the systems closely modelled actual stream flow.

One difficulty was encountered during the period of intense rainfall that occurred on Tuesday 11 January 2011, when there were extreme and rapid rises in the level of Wivenhoe Dam. The very intense rainfall generally fell directly on the Wivenhoe Dam lake and outside the catchment rain gauges, which resulted in the systems not accurately modelling the rapid rises in the Dam level. This scenario was similar to the flash flooding experienced in Lockyer Valley the previous day. The flash flooding impacted the Grantham township, however the catchment rain gauges did not record the extreme rainfall, which made it impossible for the catchment models to accurately predict the Event during this period. A review of the existing data-gathering network (which discusses this issue) is contained in Section 12.

In summary, there were no operational flaws or errors detected in the existing RTFM system that adversely impacted Event decision making.

15.2 Future of the RTFM

The RTFM and software was originally developed more than 15 years ago and resides on the Linux Fedora Core Operating System. Both main software components (Flood-Col and Flood-Ops) run on the Linux PC known as NOAH and the back-up PC located in the Back-up FOC. Although there were no failures during the current Flood Event, a number of minor failures have occurred in recent times and the age of the software is a concern. The software continues to function adequately from an operational perspective, however replacement software has been under development since 2008 and is expected to be implemented and operational in 2011. Approval for the replacement system will be sought from the Dam Safety Regulator prior to implementation.

A secondary component of the original RTFM software (WIVOPS) that assisted in formulating the gate operating strategy at Wivenhoe Dam is no longer used. This software was retired in 2005 following the construction of the Dam's auxiliary spillway, comprising three fuse plugs. A number of factors were considered in this retirement process, including the age of the WIVOPS program (more than 15 years), the absence of program documentation and the complexity of the required programming changes to account for the new auxiliary spillway.

Detailed operational spreadsheets are currently used in place of WIVOPS and these worked very well during this Event (see Section 8.0 and Appendix A). WIVOPS was used as a verification tool during the Event (see Section 8.0), within the limits of its operational effectiveness. A dedicated program with similar functionality to WIVOPS has also been under development since 2010 and, when complete, will be evaluated to determine its operational role and function during an event.

Independent of the RTFM, Seqwater has developed a series of flood models for its storages, including Somerset Dam and Wivenhoe Dam. These models are linked to the BoM Enviromon data collection system and are based on URBS Models. This system provides a backup to the RTFM software in the Flood Operations Centre and was used as a verification tool during the Event. Generally, this system provided very similar modelling results to the RTFM and experienced similar difficulties to the RTFM in accurately modelling the rapid rises in the Wivenhoe Dam lake level that occurred on Tuesday 11 January 2011 as described in Section 15.1.

16 REVIEW OF FLOOD MANUAL PROCEDURES AND STRATEGIES

16.1 Intent of the Manual

The Manual of Operational Procedures for Flood Mitigation at Wivenhoe Dam and Somerset Dam (Revision 7) (the Manual) defines the objectives and procedures for operating the Dams during flood events.

Formatted: Font: Italic

Flood events that impact Somerset Dam and Wivenhoe Dam are caused by rainfall events that vary in intensity, duration and distribution over a catchment area exceeding 7,000km² above the Dams. When making decisions about releasing water from the Dams during flood events, consideration is also given to rain falling in Brisbane River catchment areas not controlled by the Dams. These catchment areas, which include the Lockyer Creek and Bremer River catchments, also cover an area in the order of 7,000km² and rain falling in these catchments will also vary in intensity, duration and distribution. Accordingly, the Manual must account for an infinite number of flood event scenarios.

The current level of forecasting technology does not make it possible for the Bureau of Meteorology (BoM) to provide completely accurate rainfall forecasts for the Dam catchment areas. A degree of uncertainty exists in all weather forecasts and the further forward in time forecasts are provided, the greater the degree of uncertainty.

As it is not possible to provide a specific procedure for Dam operation during even possible flood event, the Manual takes the approach of providing objectives and strategies to guide operational decision-making during a flood event. The objective followed and strategy chosen at any point in time depends on the actual water levels in the Dams as well as flood modelling predictions based on the best observed and forecast rainfall and stream flow information available at the time.

It is not possible to predict the range of objectives and strategies that will be used during the course of a flood event, before or at any time during the event, prior to the event peak. Objectives and strategies change as flood events progress, as rainfall is received in the catchment and as forecast rainfall amounts change. For small floods, objectives and strategies relate to minimising flood impacts in rural areas, while as the scale of the flood increases, the emphasis changes to protecting urban areas and maintaining the structural safety of the Dam.

Deleted: ¶

16.2 Use of the Manual objectives

The primary objectives of the procedures contained in the Manual, in order of importance, are:

1. Ensure the structural safety of the Dams;
2. Provide urbanised areas with optimum protection from inundation;
3. Minimise the disruption to rural life in the valleys of the Brisbane River and Stanley River;
4. Retain the storage at Full Supply Level at the conclusion of the flood event;
5. Minimise impacts to riparian flora and fauna during the drain down phase of the flood event.

To meet these objectives, the Dams must be operated in a manner that considers the potential effects of closely spaced flood events. Accordingly, normal procedures require stored floodwaters to be emptied from the Dams within seven days of the flood event peak passing through the Dams.

Throughout the duration of this Event, the Manual objectives were always considered in order of importance, and the requirement to empty the stored floodwaters within seven days of the flood event peak passing through the Dams was also achieved.

Additionally, while ensuring the Dams are operated during flood events within the Manual objectives, Seqwater's duty of care to the public is also a primary consideration when making flood releases from the Dams. Every attempt is made to ensure public roads are closed prior to inundation by Dam outflows and that authorities are provided with enough time to prepare for community isolations and to undertake evacuations. Every attempt is also made to ensure urban damage is minimised, and that Dam outflows with the potential to

16 REVIEW OF FLOOD MANUAL PROCEDURES AND STRATEGIES

contribute to urban damage are delayed until it is apparent no other options are available without risking the safety of the Dams.

Following the Event, some discussions occurred in the public arena in relation to lowering the emphasis on minimising disruption to rural life in the valleys of the Brisbane and Stanley Rivers for anything but very minor events. Due to the associated impacts to the public, changing this emphasis remains a political decision, however it is noted the Dams could be operated in this way if desired. However, changing the emphasis of the objectives would also require a change to the current version of the Manual.

16.3 Use of the Manual strategies

As discussed in detail in Section 10, a range of strategies were used during the Event, in accordance with the Manual. Having to apply the strategies during such an extremely large and rare event provided the opportunity to consider how the strategies are worded from a practical sense.

The strategies provided a good guide in responding to the full range of scenarios presented by this Event, however some situations would benefit from additional points of clarification, and these are discussed below. It should be noted however, that due to the high degree of scenario variability, improving the Manual in this regard may not be possible. Any changes to the Manual in the areas discussed below would require extensive and detailed engineering and hydrological investigations prior to any proposed changes being formally adopted.

- Under Strategy W3, it would be useful for additional guidance to be provided as to the extent to which the flow at Moggill should be minimised prior to the natural peak occurring at that location. During the Event, this requirement competed with the need to protect urban areas by not allowing Wivenhoe Dam to reach a level that invoked Strategy W4. After considering these issues during the Event, it was decided the best course of action would be to increase releases to the limit of non-damaging flows at Moggill, prior to the natural peak occurring at Moggill. This ensured the structural safety of the Dams and provided urbanised areas with optimum protection from inundation.
- Under Strategy W3, it would be useful to clarify the flow at Moggill that defines the upper limit of non-damaging floods downstream. During the Event, Brisbane City Council provided information and damage curves to the Flood Operations Centre indicating the upper limit flow at Moggill was 3,000m³/s, whereas the Manual specifies the flow as 4,000m³/s. This number must be agreed as it defines the intent of Strategy W3.
- Under Strategy W4, additional guidance on gate closing sequences would be useful. During the Event, a decision was made to begin closing the gates as quickly as possible, to reduce urban flood impacts once the Wivenhoe Dam level peaked. This was decided in an attempt to minimise urban damage below Moggill (an objective which must be considered under Strategy W4). Gates would have been re-opened if further lake level rises were experienced, however this scenario is not specifically addressed in the Manual.
- Under Strategy S2, additional guidance on actions to take when the Wivenhoe Dam Level is falling and the Somerset Dam Level is below 100.45m would be useful.

Deleted: .0

17 REVIEW OF WIVENHOE DAM FULL SUPPLY LEVEL

Following the January 2011 Flood Event, there has been significant public discussion around the appropriate Full Supply Level (FSL) of the Dams and whether the FSL should be lowered.

The FSL of Somerset Dam and Wivenhoe Dam are contained in the Moreton Resource Operations Plan (see pages 91 and 93), which was developed by the Department of Environment and Resource Management (DERM) in accordance with the *Water Act 2000*. DERM is responsible for developing and approving all resource operations plans in Queensland, and the current Moreton Resource Operations Plan was approved by Governor-in-Council in December 2009. It is publicly available on the DERM website (www.derm.qld.gov.au). Seqwater's Resource Operations Licence requires compliance with the relevant parts of the Moreton Resource Operations Plan, including the prescribed FSL.

The Manual states:

1. that an explicit objective is to *"retain the storage at full supply level at the conclusion of the Flood Event"*. In Section 3.5 of the Manual, it states *"as the dams are the primary urban water supply for South East Queensland, it is important that all opportunities to fill the dams are taken. There should be no reason why the dams should not be full following a Flood Event"*;
2. in Section 8.3, *"the spillway gates are not to be opened for flood control purposes prior to the reservoir level exceeding EL 67.25 which is 0.25 metres above FSL"*;

In view of the above, Flood Operations Engineers did not set the FSL of the Dams and they are not authorised to make decisions in relation to setting or changing the FSL of the Dams at any time, either during or following Flood Events.

If a decision is to be made by DERM to permanently lower the FSL, detailed consideration will need to be given to the procedures in the Manual as the procedures assume the existing FSL.

18 REVIEW OF AGENCY COMMUNICATION

Deleted: 0

As discussed in Section 14, Queensland's disaster management response is provided by various disaster management groups at local, district and State levels. This collaborative approach to disaster response ensures an effective and timely coordination of information and services state-wide, whenever disaster strikes.

During the January 2011 Flood Event, a Communication Protocol (that was developed following the October 2010 Flood Event) was used to manage communications between Seqwater and the relevant local, State and Commonwealth agencies impacted by the release of floodwater from the Dams. From Seqwater's perspective, the Protocol worked well and communications were managed effectively. However, to properly assess communications, detailed feedback on the effectiveness of Seqwater communications during the Flood Event must be obtained from the following agencies:

- Brisbane City Council;
- Ipswich City Council;
- Somerset Regional Council;
- Water Grid Manager;
- Queensland Police Service;
- Department of Community Safety;
- Department of Environment and Resource Management;
- Department of Premier and Cabinet;
- Bureau of Meteorology.

To date, this process has not commenced however, this work will proceed as soon as appropriate personnel are available to undertake the necessary review.

In the interim, Seqwater has provided comment below and suggested preliminary recommendations to improve communications during flood events, based on the experiences of the January 2011 Event.

The comments and preliminary recommendations are made in accordance with the three stages in the communication process contained in the Protocol, which are:

1. Monitoring and assessment;
2. Briefing and activation;
3. Public communications.

The comments and preliminary recommendations are summarised below.

1. Monitoring and assessment

- Seqwater discussions with BoM relating to modelling result comparisons, and actual and projected Dam outflows worked well and were beneficial to both parties.
- Seqwater also provided modelling results to Brisbane City Council. It remains unclear how Council used this information or if it proved beneficial. Generally, it appears the most relevant information required by the Council was projected flood height data, and this is estimated and issued by BoM. It is recommended the provision of technical data from Seqwater to Brisbane City Council be examined further with Council, with a view to ensuring only useful data is provided to avoid any potential confusion associated with the provision of superfluous data.
- It is also recommended that investigations be undertaken to explore the benefits of a more formal arrangement with BoM in relation to the provision of rainfall forecast information during flood events. While sufficient rainfall forecasting information was available to the Flood Operations Centres during the Flood Event, and regular informal discussions were held with BoM in relation to the forecasts, there may be an opportunity to improve this process by including some appropriate procedures in the Communication Protocol.

18 REVIEW OF AGENCY COMMUNICATION

Deleted: _____

2. Briefing and activation

Situation Reports and Technical Situation Reports were provided to relevant government agencies at regular intervals over the duration of the Event. There has not been any specific feedback received to date indicating whether this process worked well. However, as previously discussed, Seqwater will seek detailed feedback on the effectiveness of its communications with the agencies involved, with a view to implementing any suggested improvements arising from these discussions.

3. Public communications issues

There were no specific public communications made by Seqwater during the January 2011 Flood Event, as the Water Grid Manager was assigned the responsibility of being the State's lead communication agency on floodwater release information. Seqwater operational staff ensured technical information was communicated to the Water Grid Manager, as requested, to support all public communication.

It is understood the Water Grid Manager is currently reviewing the effectiveness of these processes.

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHECKED OR VERIFIED INFORMATION

19 REPORT CONCLUSIONS

Following are the significant conclusions drawn from the information contained in this Report.

The significant conclusions drawn from the information contained in this Report include:

- During the January 2011 Flood Event, Somerset Dam and Wivenhoe Dam were operated in accordance with *The Manual of Operational Procedures for Flood Mitigation at Wivenhoe Dam and Somerset Dam (Revision 7)*.
- The data collection and flood modelling systems used to support decisions made during the Event performed well and assisted informed decision-making, in accordance with the Manual.
- BoM rainfall forecasts did not support the additional release of flood water early in the Event.
- During the Event, Seqwater followed the Department of Environment and Resource Management's draft Communications Protocol which was compiled after the October 2010 flood event. This Protocol was developed to ensure effective communication between local, State and Commonwealth agencies impacted by the release of floodwater from the Dams.
- The January 2011 Flood Event was an extremely large and rare flood event. The combined effects of Somerset Dam and Wivenhoe Dam did reduce flood damages downstream however, they could not fully mitigate the impacts of the Event without putting the safety of the Dams at risk.
- Studies associated with the design and operation of Wivenhoe Dam dating back to 1971, indicate a flood of the magnitude of the January 2011 Flood Event would be expected to result in urban damage below Moggill.
- The combined effects of Somerset Dam and Wivenhoe Dam provided clear and greatly significant flood mitigation benefits during the January 2011 Flood Event.

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHECKED OR VERIFIED INFORMATION

20 REPORT RECOMMENDATIONS

Following is a summary of the key recommendations contained in this report.

- In conjunction with the Bureau of Meteorology (BoM) and other relevant agencies, examine whether additional rain gauges should be installed in the Brisbane River Basin to improve the level of data recorded during flood events. It is recognised that undertaking this exercise still may not guarantee the rain gauge network will detect all instances of very intense or extreme rainfall that could occur in the Basin area.
- Given that a rare and very large flood event occurred, it is recommended a formal review of The Manual of Operational Procedures for Flood Mitigation at Wivenhoe Dam and Somerset Dam (Revision 7) (the Manual) be undertaken. This is a requirement of the Manual when an event of this nature is experienced. The issues raised in Section 16.0 should be considered in this process.
- In conjunction with BoM and other relevant agencies, it is recommended Seqwater participate in a review of the Agency Communications Protocol used during the Flood Event. This Event was the first major test of the Protocol since its development in October 2010 and therefore a full review at this time would be appropriate.

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHECKED OR VERIFIED INFORMATION

APPENDIX A – MODEL RESULTS

The following table and associated graphs represent a summary of the model results used to support operational decision making during the Event. Only model runs at the critical times corresponding to the Flood Event Summary contained in Section 2 of this Report, are included in the summary however, model runs between these times are also available. Model run numbers have been edited to provide a sequential list. An indication of the number of additional runs that are available between individually presented runs can be determined by examining these model run numbers.

During the Event some model runs were over-written as new model runs are generally created by using the most recent model run as a base. If the run being used as a base is not explicitly saved, it will be lost. This does not present a problem from an operational sense because historical model runs, which do not consider the effects of rainfall between the time of a decision and the time the historical run was created, have little bearing on operational decision making.

For the purpose of this Report, any over-written model runs have been re-created. This is possible at any time from when the model run was initially created to the future because all model runs are based on actual rainfall recorded in the relevant rain gauges at the time the model run was created. This information is contained in a data archive and, if required, can also be obtained separately and independently from BoM for verification purposes. In the case of model runs containing forecast rainfall, the forecast rainfall used was based on the BoM catchment average Quantitative Precipitation Forecasts (QPFs) contained in Appendix C.

When examining the model results, it should be noted the forecast rainfall model results apply the full 24-hour catchment average rainfall forecast from the BoM QPF's to the model run. This is regardless of the model run time in relation to the issue time of the forecast and regardless of the rainfall since the forecast was issued. In effect, this provides a "worst case" 24-hour scenario.

Finally, the values and graphs contained in this Appendix are obtained from the flood modelling spreadsheets. Similar to the modelling runs, the creation of saved spreadsheets in this Appendix corresponds to the critical times contained in the Flood Event Summary. During the Event, the spreadsheets were updated continuously with both updated model results and hourly manual water level readings from the Dams, with a single "live" spreadsheet always being available to be used as the basis of flood operations decision making. During the Event, spreadsheets were not necessarily explicitly saved at times corresponding to the Flood Event Summary, and in a similar manner to the re-creation of model runs where this has not occurred, spreadsheets have been re-created from archived data.

APPENDIX A – MODEL RESULTS

Summary of operational runs

RUN DATE	RUN	SOMERSET				WIVENHOE				Loetzer			Bromer			With Wivenhoe			Without Wivenhoe

APPENDIX D – CATCHMENT RAINFALL

Average rainfall for each subcatchment in the Brisbane Basin is determined by applying a weighting to the rainfall depth at each available station within the subcatchment.

Within the operational system, the Brisbane Basin is divided into the subcatchments shown in the Figure below.

The Somerset catchment represents the average catchment rainfall in the Stanley River to Somerset Dam.

The upper Brisbane River to Wivenhoe Dam, excluding the Somerset Dam catchment, is a weighted average of the upper and middle Brisbane catchments.

Two tables of catchment rainfall are provided; the first is of daily catchment rainfall in the 24 hours on the date shown, while the second corresponds to critical periods listed in the operational strategy.

Period ending 09:00	Stanley		Upper Brisbane		Lockyer		Bremer		Lower	
	Period	Σ	Period	Σ	Period	Σ	Period	Σ	Period	Σ
	mm	mm	mm	mm	mm	mm	mm	mm	mm	mm

APPENDIX E – SITUATION REPORTS

Situation Report 1

Date: Thursday 6 January 2011

Time: 08:14

From: Duty Engineer

Sent: Thursday, 6 January 2011 8:14 AM

To: Distribution List

Subject: Situation Report 0800 06/01/2011

Rainfall

Since 9am Wednesday, there have been widespread falls of 30mm with isolated heavy falls up to 50mm in the Somerset and Wivenhoe catchments. Totals in the North Pine catchment have generally been below 10mm. Falls up to 60mm were recorded in the Leslie Harrison catchment.

The forecast for the next 24 to 48 hours is for totals up to 150mm in SE Qld.

The catchments remain wet and are likely to generate additional runoff in the event of rain.

North Pine Dam

At 0700 Thursday, North Pine Dam was 39.60m, 0.05m below gate trigger level and having risen 0.18m since 2/1/2011 due to a combination of baseflow and runoff from rain in the last 24 hours.

Given the forecast rain, gate operations will commence tonight. MBRC will be advised this morning

Somerset Dam

At 0700 Thursday, Somerset Dam was 99.34m, 0.34m above FSL, and rising slowly. The rain in the Stanley River catchment has produced a small amount of runoff in the upper Stanley but there have been significant rises in Kilcoy Ck. Further regulator operations will be required later Thursday.

Wivenhoe Dam

At 0700 Thursday, Wivenhoe Dam was 67.31m and rising slowly. This is 0.31m above FSL and above the gate trigger level of 67.25m. There have been rises recorded at rivers and stream upstream of Wivenhoe Dam. Gates will be opened in the next 24 hours to manage the inflows from the upper Brisbane River and the outflow from Somerset.

Impacts of Wivenhoe Dam Releases

Somerset Regional, Ipswich City and Brisbane City Councils will be advised of the potential for gate operations after a full assessment of the situation this morning. At this stage it is anticipated that peak releases from Wivenhoe will be below 500m³/s but this will depend on the forecast rain and flows downstream of the dam.

The expected Wivenhoe release and local flows will at least impact upon Twin Bridges, Savages Crossing, Kholo Bridge and Colleges Crossing for several days. At this stage,

APPENDIX E – SITUATION REPORTS

there are not expected to be any adverse impacts upon Fernvale Bridge, Burtons Bridge or Mt Crosby Weir Bridge

Leslie Harrison Dam

Following the heavy rainfall Wednesday night, gate operations commenced at Leslie Harrison Dam late Wednesday night and are continuing. Given the forecast rainfall, gate operations are expected to continue for the next 24 to 48 hours.

The next situation report will be issued at 1800 Thursday 6/1/2011.

APPENDIX E – SITUATION REPORTS

Situation Report 2

Date: Thursday 6 January 2011

Time: 14:54

From: Duty Engineer

Sent: Thursday, 6 January 2011 14:54

To: Distribution List

Cc: Distribution List

Subject: Situation Report 1500 06/02/2011

Rainfall

In the 6 hours since 9am Wednesday, there have been general totals around 30mm with isolated heavy falls up to 60mm in the Somerset and Wivenhoe catchments. Totals in the North Pine catchment have generally been between 20 and 30mm. Falls between 20 and 30mm were recorded in the Leslie Harrison catchment.

The forecast for the next 24 to 48 hours is for totals up to 100mm in SE Qld.

The catchments remain wet and are likely to generate additional runoff in the event of rain.

North Pine Dam

At 1400 Thursday, North Pine Dam was 39.66m, 0.01m above gate trigger level. Gate operations will commence at 1900 Thursday and will impact upon Youngs Crossing. MBRC have been advised and will confirm closure of Youngs Crossing prior to gate operations. Given the forecast rainfall during Friday, gate operations may continue into Saturday.

Somerset Dam

At 0700 Thursday, Somerset Dam was 99.34m, 0.34m above FSL, and rising slowly. The rain in the Stanley River catchment has produced a small amount of runoff in the upper Stanley but there have been significant rises in Kilcoy Ck, adding to the Somerset inflows. Further regulator/slucice operations will be required in the next 24 to 48 hours. The estimated event inflow volume into Somerset Dam is 50,000ML.

Wivenhoe Dam

At 0700 Thursday, Wivenhoe Dam was 67.31m and rising slowly. This is 0.31m above FSL and above the gate trigger level of 67.25m. There have been rises recorded at rivers and stream upstream of Wivenhoe Dam. The estimated event inflow volume into Wivenhoe Dam is 180,000ML including Somerset Dam outflow.

There has been significant rainfalls in the Lockyer Ck catchment since 0900 Thursday and a peak of about 600m³/s is expected from the Lockyer late Friday. Wivenhoe gates will be opened after flood levels in the lower Lockyer subside. At this stage Wivenhoe releases during Saturday may be as high as 1,500m³/s and continue for a couple of days.

APPENDIX E – SITUATION REPORTS

Impacts of Wivenhoe Dam Releases

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the potential for gate operations during the next 24 hours.

The will at least impact upon Twin Bridges, Savages Crossing, Kholo Bridge and Colleges Crossing for several days. The relatively high Lockyer flows will at least impact upon Twin Bridges, Savages Crossing, Kholo Bridge and Colleges Crossing for several days and may impact upon Burtons Bridge early Saturday. At this stage, there are not expected to be any adverse impacts upon Fernvale Bridge or Mt Crosby Weir Bridge.

Leslie Harrison Dam

Following the heavy rainfall Wednesday night, gate operations commenced at Leslie Harrison Dam late Wednesday night and are continuing. Given the forecast rainfall, gate operations are expected to continue for the next 24 to 48 hours.

The next situation report will be issued at 1800 Thursday 6/1/2011.

In the 8 hours since 9am Wednesday, there have been general totals around 30mm with isolated heavy falls up to 60mm in the Somerset and Wivenhoe catchments. There have been significant rainfalls in the Lockyer Ck catchment in the last 24 hours with widespread falls of 50mm and isolated falls up to 75mm. Totals in the North Pine catchment have generally been about 30mm. Falls between 20 and 30mm were recorded in the Leslie Harrison catchment.

The forecast for the next 24 to 48 hours is for totals up to 100mm in SE Qld.

North Pine Dam

At 1700 Thursday, North Pine Dam was 39.68m, 0.03m above gate trigger level. Gate operations will commence at 1900 Thursday and will impact upon Youngs Crossing. Moreton Bay Regional Council has been advised and will confirm closure of Youngs Crossing prior to gate operations. Given the forecast rainfall during Friday, gate operations may continue into Saturday.

Somerset Dam

At 1700 Thursday, Somerset Dam was 99.45m, 0.45m above FSL, and rising slowly. The rain in the Stanley River catchment has produced a small amount of runoff in the upper Stanley but there have been significant rises in Kilcoy Ck, adding to the Somerset inflows. Further regulator/slucice operations will be required in the next 24 to 48 hours. The estimated event inflow volume into Somerset Dam is 50,000ML.

Wivenhoe Dam

At 1700 Thursday, Wivenhoe Dam was 67.39m and rising slowly. This is 0.39m above FSL and above the gate trigger level of 67.25m. Upstream of the dam river levels are still rising at the Linville and Gregors Ck gauges. The estimated event inflow volume into Wivenhoe Dam is 180,000ML including Somerset Dam outflow.

A peak of about 600m³/s is expected from the Lockyer late Friday. At this stage there is some uncertainty associated with this estimate and it may or may not impact Burtons Bridge. Wivenhoe gates will be opened after the impact of Lockyer flows on Burtons Bridge has been ascertained and flood levels in the lower Lockyer subside. At this stage Wivenhoe releases will commence late Friday/early Saturday and may be as high as 1,500m³/s, similar to recent events, and continue for a couple of days.

APPENDIX E – SITUATION REPORTS

Impacts of Downstream of Wivenhoe

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the potential for gate operations during the next 24 hours.

The relatively high Lockyer flows will adversely impact upon Twin Bridges, Savages Crossing, Kholo Bridge and Colleges Crossing for several days and may impact upon Burtons Bridge early Saturday. At this stage, there are not expected to be any adverse impacts upon Fernvale Bridge or Mt Crosby Weir Bridge.

Leslie Harrison Dam

Following the heavy rainfall Wednesday night, gate operations commenced at Leslie Harrison Dam late Wednesday night and are continuing. Given the forecast rainfall, gate operations are expected to continue for the next 24 to 48 hours.

The next situation report will be issued at 0600 Friday 7/1/2011.

APPENDIX E – SITUATION REPORTS

Situation Report 5

Date: Friday 7 January 2011

Time: 17:57

From: Duty Engineer

Sent: Friday, 7 January 2011 5:57 PM

To: Distribution List

Subject: Situation Report 1800 Friday 07/01/2011

Rainfall

Since 0900 Friday, there has been widespread 20 to 40mm throughout North Pine, Somerset and Wivenhoe catchments with isolated higher totals of 70mm in the upper reaches of the Brisbane R.

Advice from BoM indicates that SE Qld can expect further high rainfall totals over the next 4 days.

Saturday: Rain light at times 15-50mm with higher falls along the coast
Sunday: Widespread rain with totals between 50-100mm
Monday: Widespread rain again with totals between 50-100mm
Tuesday: Rain easing with totals between 25-50mm

Given the saturated conditions of the catchments, significant inflows to Seqwater dams will be generated, especially following the forecast rainfall on Sunday/Monday

North Pine (Full Supply Level 39.60 m AHD)

At 1700 Friday, North Pine currently has 5 gates open releasing runoff from rain on Wed/Thursday. Given the very high likelihood of significant runoff during the next 4 days, gates will be kept open to match inflows over the next few days, rather than opening and closing at various times with short notice. Youngs Crossing will remain adversely impacted for the duration of the gates being open. Moreton Bay Regional Council has been advised and concurs with this strategy.

Somerset (Full Supply Level 99.00 m AHD)

At 1700 Friday, Somerset Dam level was 100.04m AHD and rising steadily with one regulator open 100%. However, as the Wivenhoe headwater level is rising and may impact upon the operation of the regulator, this will be closed in the next few hours and a sluice gate opened. However, this strategy may need to be reviewed if significant runoff occurs in the Stanley and Upper Brisbane. Under circumstances of high inflows to Somerset and Wivenhoe, it is the usual practice to hold flood water in Somerset until there is a high level of confidence in the estimated inflows to Wivenhoe.

Since the commencement of the event on 02/01/2011, approximately 55,000ML has flowed into Somerset Dam with a further 25,000ML expected based on the recorded rainfall to date. Approximately 16,000ML has been released into Wivenhoe.

APPENDIX E – SITUATION REPORTS

Wivenhoe (Full Supply Level 67.00 m AHD)

At 1700 Friday, Wivenhoe Dam was 68.10 m AHD and rising steadily with one gate open to 1.5 metres and releasing about 168m³/s. River levels upstream of Wivenhoe Dam were rising again, generating further inflow to the dam. It is intended to ramp up the release from Wivenhoe to about 1,200m³/s during the next 18 hours. However, given the high likelihood of significant inflows in the next week, this may be increased later on the weekend.

Since the commencement of the event on 02/01/2011, approximately 140,000ML has flowed into Wivenhoe Dam with a further 160,000ML expected (including Somerset release) based on the recorded rainfall to date. Approximately 24,000ML has been released from Wivenhoe via the hydro and regulator at about 50m³/s.

Impacts downstream of Wivenhoe

The projected Wivenhoe release of 1,200m³/s combined with Lockyer flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Savages Crossing, Burtons Bridge, Kholo Bridge and Colleges Crossing) will be adversely impacted for several days. At this stage Fernvale and Mt Crosby Weir Bridge are not expected to be affected.

Discussions were held with Brisbane City Council and BoM with all agencies agreeing that the combined flow in the lower Brisbane R will only add 50mm to an upper limit of 100mm to the recorded water levels in the City Reach of the Brisbane River. However, it is noted that tides in the lower Brisbane R will be 0.4 to 0.5 metres higher than predicted tides.

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the Wivenhoe operating strategy.

Leslie Harrison

Given its proximity to the coast Leslie Harrison is likely to be most impacted by the forecast rain over the next 4 days.

APPENDIX E – SITUATION REPORTS

Situation Report 7

Date: Saturday 8 January 2011

Time: 06:32

From: Duty Engineer

Sent: Saturday, 8 January 2011 6:32 AM

To: Distribution List

Subject: Situation Report 0600 Saturday 08/01/2011

Rainfall

Since 0900 Friday, there has been widespread 20 to 40mm throughout North Pine, Somerset and Wivenhoe catchments with isolated higher totals of 70mm in the upper reaches of the Brisbane R. No significant rain has fallen in the past 12 hours.

Advice from BoM indicates that SE Qld can expect further high rainfall totals over the next 4 days.

Saturday: Rain light at times 5-50mm with higher falls along the coast

Sunday: Widespread rain with totals between 50-100mm

Monday: Widespread rain again with totals between 50-100mm

Tuesday: Rain easing with totals between 25-50mm

Given the saturated conditions of the catchments, significant inflows to Seqwater dams will be generated, especially following the forecast rainfall on Sunday/Monday

North Pine (Full Supply Level 39.60 m AHD)

At 0600 Saturday, North Pine Lake Level was 39.46 m AHD and slowly rising. Currently 3 gates are open to release runoff from rain on Wed/Thursday/Friday. Given the very high likelihood of significant runoff during the next 4 days, gates will be kept open to match inflows over the next few days, rather than opening and closing at various times with short notice. Youngs Crossing will remain adversely impacted for the duration of the gates being open. Moreton Bay Regional Council has been advised and concurs with this strategy.

Somerset (Full Supply Level 99.00 m AHD)

At 0500 Saturday, Somerset Dam level was 100.42m AHD and rising. The Dam is releasing into Wivenhoe through one open sluice gate. Water will be temporarily held in Somerset to allow the inflow from the upper Brisbane to be passed through the system. However, this strategy may need to be reviewed if significant runoff occurs in the Stanley and Upper Brisbane. Under circumstances of high inflows to Somerset and Wivenhoe, it is the usual practice to hold flood water in Somerset until there is a high level of confidence in the estimated inflows to Wivenhoe.

Since the commencement of the event on 02/01/2011, approximately 85,000ML has flowed into Somerset Dam with a further 20,000ML expected based on the recorded rainfall to date. Approximately 25,000ML has been released into Wivenhoe.

Wivenhoe (Full Supply Level 67.00 m AHD)

APPENDIX E – SITUATION REPORTS

At 0600 Saturday, Wivenhoe Dam was 68.45 m AHD and rising steadily with all five gates open and releasing about 890 m³/s. River levels upstream of Wivenhoe Dam were rising again, generating further inflow to the dam. It is intended to ramp up the release from Wivenhoe to 1,200m³/s by midday Saturday 08/01/2011. Further assessments will be undertaken to determine increases above this level. However, given the high likelihood of significant inflows in the next week, this may be increased.

Since the commencement of the event on 02/01/2011, approximately 200,000ML has flowed into Wivenhoe Dam (including Somerset releases) with a further 180,000ML expected based on the recorded rainfall to date. Approximately 50,000ML has been released from Wivenhoe via the hydro and regulator at about 50m³/s.

Impacts downstream of Wivenhoe

The projected Wivenhoe release of 1,200m³/s combined with Lockyer flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Savages Crossing, Burtons Bridge, Kholo Bridge and Colleges Crossing) will be adversely impacted for several days. At this stage Fernvale and Mt Crosby Weir Bridge are not expected to be affected but they could potentially be affected if the predicted rainfall totals eventuate.

The current available assessments indicate that the combined flow in the lower Brisbane R would only add 50mm to an upper limit of 100mm to the recorded water levels in the City Reach of the Brisbane Rive. However, it is noted that tides in the lower Brisbane R will be 0.4 to 0.5 metres higher than predicted tides

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the Wivenhoe operating strategy.

APPENDIX E – SITUATION REPORTS

Situation Report 8

Date: Saturday 8 January 2011

Time: 14:22

From: Duty Engineer

Sent: Saturday, 8 January 2011 2:22 PM

To: Distribution List

Subject: Seqwater Situation Report at 12:00 on Saturday 8 January 2011

Peter

I have added you to the distribution list of the Situation Report for Seqwater dams. This is distributed every 12 hours (approximately) during gate releases. Let me know if you do not wish to get this.

Rainfall

No significant rain has fallen over the dam catchments in the past 18 hours.

Advice from BoM indicates that SE Qld can expect further high rainfall totals over the next 4 days.

Saturday: Rain light at times 5-50mm with higher falls along the coast
Sunday: Widespread rain with totals between 50-100mm
Monday: Widespread rain again with totals between 50-100mm
Tuesday: Rain easing with totals between 25-50mm

Given the saturated conditions of the catchments, significant inflows to Seqwater dams will be generated, especially following the forecast rainfall on Sunday/Monday.

North Pine (Full Supply Level 39.60 m AHD)

At 1200 Saturday, North Pine Lake Level was 39.46 m AHD and is steady. Currently 2 gates are open to release runoff generated from rainfall over the last three days. Given the very high likelihood of significant runoff during the next 4 days, gates will be kept open to match inflows over the next few days, rather than opening and closing at various times with short notice. Lake Kurwongbah spillway flows are also contributing to the adverse impacts experienced at Youngs Crossing.

Youngs Crossing will remain adversely impacted for the duration of the gates being open.

Moreton Bay Regional Council has been advised and concurs with this strategy.

Somerset (Full Supply Level 99.00 m AHD)

At 1000 Saturday, Somerset Dam level peaked at 100.47m AHD and is now slowly falling. At 1200 it is now 100.45m. Somerset Dam is releasing into Wivenhoe through two open sluice gates and over the fixed crest at a rate of about 415 m³/s.

Since the commencement of the event on 02/01/2011, approximately 91,000ML has flowed into Somerset Dam with a further 20,000ML expected based on the recorded rainfall to date. Approximately 29,000ML has been released into Wivenhoe.

APPENDIX E – SITUATION REPORTS

Wivenhoe (Full Supply Level 67.00 m AHD)

At 1200 Saturday, Wivenhoe Dam was 68.60 m AHD and rising steadily with all five gates open and releasing about 1,150 m³/s. River levels upstream of Wivenhoe Dam have peaked and are now receding. However the further inflows into the dam has led to elevated levels. It is intended to increase the release from Wivenhoe to 1,250 m³/s by 14:00 on Saturday 08/01/2011. This will maintain flows of up to 1,600 m³/s in the mid-Brisbane River throughout the afternoon.

Further assessments will be undertaken to determine increases above this level given the high likelihood of significant inflows in the next few days. The interaction with runoff from the Bremer River and Warrill Creek catchment will also be assessed to determine an appropriate release strategy. Projections based upon the forecast rainfalls suggest flows of up to 1,200 m³/s will emanate from the Bremer River catchment.

Since the commencement of the event on 02/01/2011, approximately 202,000ML has flowed into Wivenhoe Dam (including Somerset releases) with a further 210,000ML expected based on the recorded rainfall to date. Approximately 66,000ML has been released from Wivenhoe via the radial gates, hydro and regulator.

Impacts downstream of Wivenhoe

The projected Wivenhoe release of 1,250m³/s and combined with Lockyer flows and local runoff will mean that all low level crossings downstream of Wivenhoe (Twin Bridges, Savages Crossing, Burtons Bridge, Kholo Bridge and Colleges Crossing) will be adversely impacted for several days. At this stage Fernvale and Mt Crosby Weir Bridge are not expected to be affected, but they could potentially be affected if the predicted rainfall totals eventuate and higher releases from Wivenhoe Dam are considered necessary.

The current available assessments indicate that the combined flow in the lower Brisbane River would only add 50mm to an upper limit of 100mm to the recorded water levels in the City Reach of the Brisbane River. However, it is noted that tides in the lower Brisbane R will be 0.4 to 0.5 metres higher than predicted tides. The tide level at the Port Office Gauge at 1200 Saturday was 1.56 m and rising.

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the Wivenhoe operating strategy.

Regards

APPENDIX E – SITUATION REPORTS

Situation Report 9

Date: Sunday 9 January 2011

Time: 17:51

From: Duty Engineer
Sent: Sunday, 9 January 2011 5:51 PM
To: Distribution List
Cc: Distribution List
Subject: Situation Report 1700 Sunday 9/1/2011

Rainfall

Catchment average rainfall for the past 12 hours is; North Pine Dam (60 mm); Somerset Dam (150 mm); Wivenhoe Dam (80 mm). The bulk of the rain that has fallen in the upper reaches of the Stanley and Brisbane Rivers.

The BOM rainfall forecast for the next few days is:-

Monday:	Very heavy rain periods with totals up to 300mm centred around North Pine.
Tuesday:	Rain periods with totals up to 150mm centred around North Pine.
Wednesday	A few showers less than 10mm
Thursday	A shower or two.
Friday	A shower or two.
Saturday	Mostly fine.

A severe weather warning remains current for heavy rainfall in the dam catchment areas. The dam catchments are relatively saturated and significant inflows will be generated if the forecast rainfall eventuates.

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level is currently 39.65 m AHD and rising at 1600. Following the rain in the 9 hours, the number of open gates has been increased from 2 to 5 which are expected to remain open for the next 12 hours. Youngs Crossing will remain closed while releases are in progress.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 100.75 m AHD and rising quickly. Estimated peak inflow to the dam is about 3,000m³/s. Five sluice gates are open releasing about 1,100m³/s (95,000ML/d) into Wivenhoe Dam. At this stage the dam will reach at least 101.5 during early Tuesday morning.

Since the commencement of the event on 02/01/2011 approximately 80,000ML has been released from the dam, with an event total of at least 320,000ML based on the recorded rainfall to date. The event total is expected to increase significantly due to the forecast rain in the next 24 to 48 hours. At this stage, releases will continue until at least Wednesday.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

APPENDIX E – SITUATION REPORTS

The dam level is currently rising again, with the current level being 68.70m AHD. Estimated peak inflow to the dam just from the Upper Brisbane R is about 5,000m³/s and, at this stage, the dam will reach at least 72.5 m AHD during Wednesday morning. River levels upstream of the dam are rising quickly with significant inflow being generated from the intense heavy rainfall. The current gate operation strategy will maintain flows of around 1,600m³/s in the mid-Brisbane River for the next 24 hours. This may mean temporarily reducing releases from Wivenhoe Dam as Lockyer flows increase. However, releases may have to be increased significantly during Monday depending on the rain in the next 12 to 24 hours. The current release rate from Wivenhoe Dam is 1,400m³/s (120,000ML/day).

Since the commencement of the event on 02/01/2011 approximately 210,000ML has been released from the dam, with an event total approaching 1,000,000ML (including Somerset outflow) based on the recorded rainfall to date. The total release for the event is likely to increase over the next few days based on the current rainfall forecasts. At this stage, releases will continue until at least Saturday 15th January 2011.

Impacts downstream of Wivenhoe Dam

The current Wivenhoe Dam release combined with Lockyer flows and local runoff will mean that all low level crossings downstream of Wivenhoe (Twin Bridges, Savages Crossing, Burtons Bridge, Kholo Bridge and Colleges Crossing) will be adversely impacted until at least Saturday 15 January.

At this stage Fernvale and Mt Crosby Weir Bridge will not be affected for the next 24 hours but there is a strong possibility that, if the predicted rainfall totals eventuate in the next 12 to 24 hours, higher releases from Wivenhoe Dam will be necessary. This may adversely impact upon Fernvale and Mt Crosby Weir Bridges as early as Tuesday morning.

Water levels in the lower Brisbane R will be impacted by the combined flows of Lockyer Ck, Bremer River, local runoff and releases from Wivenhoe Dam.

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the Wivenhoe operating strategy.

APPENDIX E – SITUATION REPORTS

Situation Report 10

Date: Sunday 9 January 2011

Time: 21:04

From: Duty Engineer
Sent: Sunday, 9 January 2011 9:04 PM
To: Distribution List
Cc: Distribution List
Subject: Situation Report 2100 9/01/2011
Importance: High

Rainfall

Very heavy rainfall has been recorded in the upper reaches of the Brisbane and Stanley in the last 6 hours with totals up 100 to 140mm. Totals for the last 24 hours range from 100 to 300mm.

Rainfall of similar magnitudes is expected in the 12 to 24 hours, especially around the Bremer/Warrill catchments as the system tracks south.

A severe weather warning remains current for heavy rainfall in the dam catchment areas.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 101.68 m AHD (about 500,000ML currently in storage) and rising quickly. Peak inflow to the dam is estimated to be about 4,000 m³/s based on observed rainfall and could be as high as 5,000m³/s with additional forecast rainfall. Five sluice gates are open releasing about 1,100m³/s (95,000ML/d) into Wivenhoe Dam. At this stage the dam will reach at least 103.5 early Tuesday morning which will adversely impact areas around Kilcoy.

Since the commencement of the event on 02/01/2011 approximately 100,000ML has been released from the dam into Wivenhoe, with an event total of the order of 520,000ML expected. This may increase due to the forecast rain in the next 24 to 48 hours. At this stage, releases will continue until at least Thursday.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

River levels upstream of the dam are rising quickly with significant inflow being generated from the intense heavy rainfall. Flows in the Brisbane River at Gregor's Ck have already reached 6,700m³/s and the river is still rising.

The dam level is rising again, with the current level being 69.10m AHD (1,410,000ML with about 300,00 of flood storage). Estimated peak inflow to the dam just from the Upper Brisbane R alone may reach as high as 7,500m³/s and, at this stage, the dam will reach at least 73.0 m AHD during Tuesday morning. Given the rapid increase in inflow volumes, it will be necessary to increase the release from Wivenhoe Monday morning.

The objective for dam operations will be to minimise the impact of urban flooding in areas downstream of the dam and, at this stage, releases will be kept below 3,500m³/s and the

APPENDIX E – SITUATION REPORTS

combined flows is the lower Brisbane will be limited to 4,000m³/s. This is below the limit of urban damages in the City reaches.

The current release rate from Wivenhoe Dam is 1,400m³/s (120,000ML/day). Gate opening will start to be increased from noon Monday and the release is expected increase to at least 2,600m³/s during Tuesday morning.

Since the commencement of the event on 02/01/2011 approximately 220,000ML has been released from the dam, with an event total approaching 1,000,000ML without further rain and as much as 1,500,000ML with forecast rainfall of (both including Somerset outflow). At this stage, releases will continue until at least Sunday 16th January 2011.

Impacts downstream of Wivenhoe Dam

The projected Wivenhoe Dam releases combined with Lockyer flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Saturday 15 January in varying degrees.

Water levels in the lower Brisbane R will be impacted by the combined flows of Lockyer Ck, Bremer River, local runoff and releases from Wivenhoe Dam.

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the updated Wivenhoe operating strategy.

APPENDIX E – SITUATION REPORTS

Situation Report 11

Date: Monday 10 January 2011

Time: 01:14

From: Duty Engineer

Sent: Monday, 10 January 2011 1:14 AM

To: Distribution List

Cc: Distribution List

Subject: FOC Situation Report at 01:00 hrs on Monday 10 January 2011

Rainfall

Very heavy rainfall has been recorded in the Upper Brisbane and Stanley Rivers in the last 12 hours with totals up 100 to 240mm. Totals for the last 24 hours range from 100 to 300mm.

Rainfall of similar magnitudes is expected in the 12 to 24 hours around the downstream catchments as the system tracks south.

A severe weather warning remains current for heavy rainfall in the dam catchment areas.

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level was 39.95 m and steady. Five gates are open releasing 445 m³/s. The inflow into the dam since the commencement of the event is 42,000 ML. Estimated event volume is 57,000 ML assuming no further rainfall. Gate operations will continue until at least Tuesday 11 January 2011.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 102.22 m AHD and rising quickly (storing 157,000 ML above FSL). Peak inflow to the dam is estimated to be about 4,200 m³/s based on observed rainfall and could be as high as 5,000m³/s with additional forecast rainfall. Five sluice gates are open releasing about 1,100m³/s (95,000ML/d) into Wivenhoe Dam. At this stage the dam will reach at least 103.5 on Monday afternoon which will adversely impact areas around Kilcoy.

Since the commencement of the event on 02/01/2011 approximately 115,000ML has been released from the dam into Wivenhoe, with an event total of the order of 520,000ML expected. This is expected to increase due to the forecast rain in the next 24 to 48 hours. At this stage, releases will continue until at least Thursday.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

River levels upstream of the dam are rising quickly with significant inflow being generated from the intense heavy rainfall. Flows in the Brisbane River at Gregor's Ck have already reached 7,350m³/s and the river has just peaked at 23:00 on Sunday 9 January.

The dam level is rising quickly, with the current level being 69.60m AHD (storing 301,000 ML). Estimated peak inflow to the dam just from the Upper Brisbane R alone may reach

APPENDIX E – SITUATION REPORTS

as high as 8,800m³/s and, at this stage, the dam will reach at least 73.3 m AHD during Tuesday morning. Given the rapid increase in inflow volumes, it will be necessary to increase the release from Wivenhoe during Monday morning.

The objective for dam operations will be to minimise the impact of urban flooding in areas downstream of the dam and, at this stage, releases will be kept below 3,500m³/s and the combined flows in the lower Brisbane will be limited to 4,000m³/s if possible.

Fernvale Bridge approaches and Mt Crosby Weir Bridge have been inundated and both bridges are now closed or are in the process of being closed.

The current release rate from Wivenhoe Dam is 1,400m³/s (120,000ML/day). Gate opening will start to be increased during early Monday morning and the release is expected to increase to at least 2,600m³/s.

Since the commencement of the event on 02/01/2011 approximately 240,000ML has been released from the dam, with an event total approaching 1,500,000ML without further rain and as much as 2,100,000ML with forecast rainfall of (both including Somerset outflow). At this stage, releases will continue until at least Sunday 16th January 2011.

Impacts downstream of Wivenhoe Dam

The projected Wivenhoe Dam releases combined with Lockyer flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Saturday 15 January in varying degrees.

Water levels in the lower Brisbane R will be impacted by the combined flows of Lockyer Ck, Bremer River, local runoff and releases from Wivenhoe Dam. If the predicted rainfall eventuates in the downstream tributary catchments the resultant combined flows in the lower Brisbane may exceed the threshold of damaging discharge in the urban areas within the next 24 to 48 hours.

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the updated Wivenhoe operating strategy.

APPENDIX E – SITUATION REPORTS

Situation Report 12

Date: Monday 10 January 2011

Time: 06:30

From: Duty Engineer

Sent: Monday, 10 January 2011 6:30 AM

To: Distribution List

Cc: Distribution List

Subject: FOC Situation Report at 06:00 on Monday 10 January 2011

Rainfall

Moderate to heavy rainfall has been recorded in the Upper Brisbane and Stanley Rivers in the last 12 hours with totals up to 90 mm. Totals for the last 24 hours range from 100 to 325mm.

Mt Glorious recorded 100 mm in the last 12 hours.

Rainfall of similar magnitudes is expected in the 12 to 24 hours around the downstream catchments as the system tracks south.

A severe weather warning remains current for heavy rainfall in the dam catchment areas.

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level was 39.97 m and steady. Five gates are open releasing 475 m³/s. The inflow into the dam since the commencement of the event is 52,000 ML. Estimated event volume is 72,000 ML assuming no further rainfall. Gate operations will continue until at least Tuesday 11 January 2011.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level at 05:00 was 102.84 m AHD and rising (storing 193,000 ML above FSL). Peak inflow to the dam is estimated to be about 4,200 m³/s based on observed rainfall and could be as high as 5,000m³/s with additional forecast rainfall. Five sluice gates are open releasing about 1,100m³/s (95,000ML/d) into Wivenhoe Dam. At this stage the dam lake level will reach about 103.5 mAHD on Monday afternoon. Areas around Kilcoy will continue to be adversely affected.

Since the commencement of the event on 02/01/2011 approximately 142,000ML has been released from the dam into Wivenhoe, with an event total of the order of 520,000ML expected. This is expected to increase due to the forecast rain in the next 24 to 48 hours. At this stage, releases will continue until at least Thursday.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

River levels upstream of the dam have peaked and are falling slowly with significant inflow being generated from the intense heavy rainfall. Flows in the Brisbane River at Gregor's Ck have peaked at 7,350m³/s at 23:00 on Sunday 9 January. This peak is bigger than January 1974 and February 1999 at this location.

APPENDIX E – SITUATION REPORTS

The dam level is rising quickly, with the current level being 70.77m AHD (storing 450,000 ML). Estimated peak inflow to the dam just from the Upper Brisbane R is around 8,800m³/s and, at this stage, the dam will reach at least 73.3 m AHD during Tuesday morning. Given the rapid increase in inflow volumes, it was necessary to start to increase the release from Wivenhoe during Monday morning.

The objective for dam operations will be to minimise the impact of urban flooding in areas downstream of the dam and, at this stage, releases will be kept below 3,500m³/s and the combined flows in the lower Brisbane will be limited to 4,000m³/s if possible. This is significantly less than the current estimated combined pre-dam peak inflow of 12,000 m³/s.

Fernvale Bridge approaches and Mt Crosby Weir Bridge have been inundated and both bridges are now closed.

The current release rate from Wivenhoe Dam is 1,753m³/s (150,000ML/day). Gate opening will continue to be increased during Monday and the release is expected to increase to at least 2,600m³/s in the next 12 to 24 hours.

Since the commencement of the event on 02/01/2011 approximately 275,000ML has been released from the dam, with an event total approaching 1,600,000ML without further rain and as much as 2,100,000ML with forecast rainfall of (both including Somerset outflow). At this stage, releases will continue until at least Sunday 16th January 2011.

Impacts downstream of Wivenhoe Dam

The projected Wivenhoe Dam releases combined with Lockyer flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Saturday 15 January in varying degrees.

Water levels in the lower Brisbane R will be impacted by the combined flows of Lockyer Ck, Bremer River, local runoff and releases from Wivenhoe Dam. If the predicted rainfall eventuates in the downstream tributary catchments the resultant combined flows in the lower Brisbane may exceed the threshold of damaging discharge in the urban areas within the next 24 to 48 hours. Currently the estimate peak flow in the lower Brisbane River will be the highest since Wivenhoe Dam was completed in 1984 but still well below flows the 1974 levels. Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the updated Wivenhoe operating strategy.

Outlook

Heavy rainfall continues throughout South East Queensland and the situation could deteriorate rapidly over the next 24 hours. The flood operation centre will continue to monitor the situation and provide every six hours until the situation stabilizes.

Subject: FOC Situation Report at 12:00 on Monday 10 January 2011

Rainfall

Rainfall has continued in the dam catchments over the last 6 hours, with approximate catchment averages as follows: North Pine (30mm); Wivenhoe Dam (20mm); Somerset Dam (40mm). A severe weather warning remains current for heavy rainfall in the dam catchment areas. The QPF issued by BOM at 10:00 estimates rainfalls for the 24 hours to 10:00 Tuesday as North Pine Dam (75mm to 150mm); Wivenhoe/Somerset Dam Catchments (50mm – 100mm).

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level is 40.00m AHD and relatively steady (storing 9,000ML above FSL). Five gates are open and releasing 500 m³/s. The inflow into the dam since the commencement of the event is 63,000 ML. Estimated event volume is 77,000 ML assuming no further rainfall. Gate operations will continue until at least Wednesday 12 January 2011.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 103.11m AHD and rising (storing 210,000 ML above FSL). Peak inflow to the dam is estimated to be about 4,200 m³/s. Five sluice gates are open releasing about 1,100m³/s (95,000ML/day) into Wivenhoe Dam. At this stage the dam lake level will reach about 103.5m AHD on Monday afternoon. Areas around Kilcoy will continue to be adversely affected.

Since the commencement of the event on 02/01/2011 approximately 182,000ML has been released from the dam into Wivenhoe, with an event total of the order of 520,000ML expected. This is expected to increase due to the forecast rain in the next 24 to 48 hours. At this stage, releases will continue until at least Thursday 13 January 2011.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

The dam level is 71.95m AHD and rising quickly (storing 610,000 ML above FSL). Peak inflow to the dam is estimated to be about 8,800m³/s. Five radial gates are open releasing about 2000m³/s (170,000ML/day) into the Brisbane River. At this stage, the dam will reach about 73.5m AHD during Tuesday morning. Flows in the Brisbane River above the dam at Gregor's Creek peaked at 7,350m³/s and this peak is bigger than both the January 1974 and February 1999 flood events at this location.

The objective for dam operations is to minimise the impact of urban flooding in areas downstream of the dam and the current aim is to keep river flows in the lower Brisbane River below 3,500m³/s if possible. This is significantly less than the current estimated combined pre-dam peak inflow of 12,000m³/s.

APPENDIX E – SITUATION REPORTS

Since the commencement of the event on 02/01/2011 approximately 325,000ML has been released from the dam, with an event total approaching 1,600,000ML without further rain and as much as 2,100,000ML with forecast rainfall of (both including Somerset outflow). At this stage, releases will continue until at least Sunday 16 January 2011.

The volume between the expected peak (73.5m AHD) and the level at which the safety of the dam becomes the primary objective in managing flood releases (74.0m AHD) is 75,000ML. The volume between the expected peak (73.5m AHD) and initiation of the first Fuse Plug is 330,000ML.

Impacts downstream of Wivenhoe Dam

The projected Wivenhoe Dam releases combined with Lockyer Creek flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Saturday 15 January in varying degrees.

Water levels in the lower Brisbane River will be impacted by the combined flows of Lockyer Creek, Bremer River, local runoff and releases from Wivenhoe Dam. If the predicted rainfall eventuates in the downstream tributary catchments the resultant combined flows in the lower Brisbane may exceed the threshold of damaging discharge in the urban areas within the next 24 to 48 hours. Currently the estimate peak flow in the lower Brisbane River will be the highest since Wivenhoe Dam was completed in 1984 but still well below flows the 1974 levels.

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the updated Wivenhoe operating strategy.

Outlook

Heavy rainfall continues throughout South East Queensland and the situation could deteriorate rapidly over the next 24 hours. The flood operation centre will continue to monitor the situation and provide every six hours until the situation stabilizes.

APPENDIX E – SITUATION REPORTS

Situation Report 14

Date: Monday 10 January 2011

Time: 18:43

From: Duty Engineer

Sent: Monday, 10 January 2011 6:43 PM

To: Distribution List

Cc: Distribution List

Subject: FOC Situation Report at 18:00 on Monday 10 January 2011

Rainfall

Only minor rainfall has been experienced in the North Pine Dam and Somerset Dam catchments with a catchment averages of less than 20mm.

However, significant rain has fallen in the Wivenhoe Dam catchment over the last 6 hours, with isolated falls exceeding 100mm. This rainfall has significantly increase inflows into the dam. A severe weather warning remains current for heavy rainfall in the dam catchment areas. The QPF issued by BOM at 10:00 estimates rainfalls for the 24 hours to 10:00 Tuesday as North Pine Dam (25mm to 50mm, with isolated falls to 100mm); Wivenhoe/Somerset Dam Catchments (25mm to 50mm, with isolated falls to 100mm). Potentially significant rain moving towards the dam catchments is currently evident on the BOM radar.

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level is 39.84m AHD and falling slowly (storing 9,000ML above FSL). Five gates are open and releasing 362 m³/s. The inflow into the dam since the commencement of the event is 72,000 ML. Estimated event volume is 84,000 ML assuming no further rainfall. Releases from the dam will continue until at least Wednesday 12 January 2011.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 103.46m AHD and rising slowly. Peak inflow to the dam is estimated to be about 4,200 m³/s. Total discharge into Wivenhoe Dam is currently 1700m³/s and this discharge will decrease slowly in the next 24 hours to be around 1200m³/s late Tuesday. The dam level will peak at 103.5m AHD in the next few hours, unless further significant rainfall is experienced. Areas around Kilcoy will continue to be adversely affected.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

The dam level is 72.92m AHD and rising quickly. Releases from the dam have been increased over the last 3 hours in accordance with Flood Mitigation procedures and to ensure that a fuse plug is not initiated. The initiation of a fuse plug will result in a rapid uncontrolled outflow from the dam of 2,000m³/s being added to the gate release outflow. Outflows into the Brisbane River from both Lockyer Creek and the Bremer River are also increasing. The flash flooding experienced in the upper areas of Lockyer Creek have been examined and are not expected to significantly increase Brisbane River flows above the current projection of 4000m³/s at Moggill.

APPENDIX E – SITUATION REPORTS

Five radial gates are currently open at the dam releasing about 2,400m³/s into the Brisbane River and this will need to be increased steadily to an outflow of 2,800m³/s. At this stage, the dam will reach about 73.8m AHD during Tuesday morning.

The objective for dam operations is currently to minimise the impact of urban flooding in areas downstream of the dam and to keep river flows in the lower Brisbane River below 4,000m³/s if possible. This is significantly less than the current estimated combined pre-dam peak inflow of 12,000m³/s. If further rainfall occurs, dam releases may need to be increased further and this may result in river flows in the lower Brisbane River approaching or exceeding 5,000m³/s.

Impacts downstream of Wivenhoe Dam

The projected Wivenhoe Dam releases combined with Lockyer Creek flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Sunday 16 January in varying degrees.

Water levels in the lower Brisbane River will be impacted by the combined flows of Lockyer Creek, Bremer River, local runoff and releases from Wivenhoe Dam.

Outlook

Heavy rainfall continues throughout South East Queensland and the situation could deteriorate rapidly over the next 24 hours. The flood operation centre will continue to monitor the situation and provide every six hours until the situation stabilizes.

APPENDIX E – SITUATION REPORTS

Situation Report 15

Date: Monday 10 January 2011

Time: 23:56

From: Duty Engineer

Sent: Monday, 10 January 2011 11:56 PM

To: Distribution List

Cc: Distribution List

Subject: FOC Situation Report at 00:00 Tuesday 11 January 2011

Rainfall

Rainfall continues in the North Pine Dam, Somerset Dam and Wivenhoe Dam catchments with falls of generally less than 20mm since 18:00 today. However, some isolated falls in the Upper Brisbane River of up to 110 mm have been recorded at Monsildale in this time. This rainfall will increase inflows into the dam.

A severe weather warning remains current for heavy rainfall in the dam catchment areas. The QPF issued by BOM at 16:00 estimates rainfalls for the 24 hours to 10:00 Tuesday as North Pine Dam (25mm to 50mm, with isolated falls to 100mm); Wivenhoe/Somerset Dam Catchments (25mm to 50mm, with isolated falls to 100mm).

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level is 39.80m AHD and falling slowly (storing 4,400ML above FSL). Five gates are open, releasing 153 m³/s. The inflow into the dam since the commencement of the event is 74,000 ML. Estimated event volume is 84,000 ML assuming no further rainfall. Releases from the dam will continue until at least Wednesday 12 January 2011.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 103.40m AHD and falling slowly. Peak inflow to the dam is estimated to be about 4,200 m³/s. Total discharge into Wivenhoe Dam is currently 1700m³/s and this discharge will decrease slowly in the next 24 hours to be around 1200m³/s late Tuesday. The dam level peaked at 103.52m AHD at 19:00 on Monday 10 January 2011, unless further significant rainfall is experienced. Areas around Kilcoy will continue to be adversely affected.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

The dam level is 73.22m AHD and rising at about 50 mm/hour. Releases from the dam have been held at a rate of 2,750 m³/s since 19:30 hours. Outflows into the Brisbane River from both Lockyer Creek and the Bremer River are also increasing.

The BoM has provided further advice about the flash flooding experienced in the upper areas of Lockyer Creek. The rainfall responsible for this event was not observed at any rainfall stations but it is considered to be very significant. Flood levels in the Lockyer Creek catchment will exceed maximum recorded levels in some stations in the upper catchment. This flow may result in increases in Brisbane River levels below the junction of Lockyer Creek.

APPENDIX E – SITUATION REPORTS

Five radial gates are currently open at the dam releasing about 2,750m³/s into the Brisbane River. At this stage, the dam will reach about 73.8m AHD during Tuesday afternoon.

The objective for dam operations is currently to minimise the impact of urban flooding in areas downstream of the dam and to keep river flows in the lower Brisbane River below 4,000m³/s if possible. This is significantly less than the current estimated combined pre-dam peak inflow of 12,000m³/s. If further rainfall occurs, dam releases may need to be increased further and this may result in river flows in the lower Brisbane River approaching or exceeding 5,000m³/s.

Impacts downstream of Wivenhoe Dam

The projected Wivenhoe Dam releases combined with Lockyer Creek flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Sunday 16 January in varying degrees.

Water levels in the lower Brisbane River will be impacted by the combined flows of Lockyer Creek, Bremer River, local runoff and releases from Wivenhoe Dam.

The BoM will provide further information regarding the magnitude of the flash flood event occurring in Lockyer Creek early Tuesday morning. Consideration will be given to modifying the releases from Wivenhoe Dam to try to moderate the peak flows emanating from Lockyer Creek.

Outlook

Heavy rainfall continues throughout South East Queensland and the situation could deteriorate over the next 24 hours. The flood operation centre will continue to monitor the situation and provide situation reports every six hours until the situation stabilizes.

Regards

APPENDIX E – SITUATION REPORTS

Situation Report 16

Date: Tuesday 11 January 2011

Time: 06:12

From: Duty Engineer

Sent: Tuesday, 11 January 2011 6:12 AM

To: Distribution List

Cc: Distribution List

Subject: FOC Situation Report at 06:00 on Tuesday 11 January 2011

Rainfall

Rainfall continues in the North Pine Dam, Somerset Dam and Wivenhoe Dam catchments. Isolated falls in the Upper Brisbane River of up to 125 mm have been recorded with widespread falls of 40 to 70 mm in the Somerset Dam catchment. This rainfall will increase inflows into the dam.

There has also been 20 to 60 mm in the Lockyer Creek catchment in the last 12 hours with falls of up to 30 mm in the Bremer River.

A severe weather warning remains current for heavy rainfall in the dam catchment areas.

The QPF issued by BOM at 16:00 estimates rainfalls for the 24 hours to 10:00 Tuesday as North Pine Dam (25mm to 50mm, with isolated falls to 100mm); Wivenhoe/Somerset Dam Catchments (25mm to 50mm, with isolated falls to 100mm).

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level is 39.80m AHD and has commenced rising again (storing 4,400ML above FSL). Five gates are open releasing 177 m³/s. The inflow into the dam since the commencement of the event is 77,000 ML. Estimated event volume is 88,000 ML assuming no further rainfall. Releases from the dam will continue until at least Wednesday 12 January 2011.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 103.27m AHD and falling slowly. Peak inflow to the dam is estimated to be about 4,200 m³/s. Total discharge into Wivenhoe Dam is currently 1400 m³/s and this discharge will be decreased in the next few hours to be around 500 m³/s later on Tuesday. This is to ensure that the combined flood mitigation capacity in Somerset and Wivenhoe Dam is maximized.

The dam level peaked at 103.52m AHD at 19:00 on Monday 10 January 2011, (unless further significant rainfall is experienced). Areas around Kilcoy will continue to be adversely affected.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

The dam level is 73.51m AHD and rising at about 25 mm/hour. Releases from the dam have been held at a rate of 2,750 m³/s since 19:30 hours on Monday 10 January 2011. Outflows into the Brisbane River from both Lockyer Creek and the Bremer River are also increasing.

APPENDIX E – SITUATION REPORTS

The BoM has provided further advice about the flash flooding experienced in the upper areas of Lockyer Creek. The rainfall responsible for this event was not observed at any rainfall stations but it is considered to be extreme. Flood levels in the Lockyer Creek catchment will exceed maximum recorded levels in some stations in the upper catchment. This flow will result in increases in Brisbane River levels below the junction of Lockyer Creek.

Five radial gates are currently open at the dam releasing about 2,750m³/s into the Brisbane River. At this stage, the dam will reach just over 74.0m AHD during Tuesday evening.

Above EL 74.0m AHD the objective for dam operations is to maintain the security of the dam and minimise downstream flood flows if possible.

If further rainfall occurs, dam releases may need to be increased further and this may result in river flows in the lower Brisbane River approaching or exceeding 5,000m³/s.

Impacts downstream of Wivenhoe Dam

The projected Wivenhoe Dam releases combined with Lockyer Creek flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Sunday 16 January in varying degrees.

Water levels in the lower Brisbane River will be impacted by the combined flows of Lockyer Creek, Bremer River, local runoff and releases from Wivenhoe Dam.

The BoM will provide further information regarding the magnitude of the flash flood event occurring in Lockyer Creek early Tuesday morning. Consideration was given to modifying the releases from Wivenhoe Dam to try to moderate the peak flows emanating from Lockyer Creek but the rainfall in the past 12 hours in the catchment above the dam makes this option not possible. Therefore instead of decreasing releases to accommodate the Lockyer Creek flows, the strategy will endeavour to maintain the current releases until Lockyer Creek peaks.

Outlook

Heavy rainfall continues throughout South East Queensland and the situation could deteriorate over the next 24 hours. The flood operation centre will continue to monitor the situation and provide situation reports every six hours until the situation stabilizes.

Duty Engineer
Flood Operations Centre

APPENDIX E – SITUATION REPORTS

Situation Report 17

Date: Tuesday 11 January 2011

Time: 12:11

From: Duty Engineer

Sent: Tuesday, 11 January 2011 12:11 PM

To: Distribution List

Subject: SitRep 1200 11/1/2011

Somerset/Wivenhoe

Our current strategy revolves around trying to prevent initiation of the first fuse plug at EL 75.6m. If this happens we will get a rapid increase of about 2,000m³/s in outflow from the dam in addition to the gate release which could be as high as 4,500 to 5,000m³/s at the time. However, it may be that fuse plug initiation might provide a lower outflow than increasing the gate outflow to protect it. In this case, we would adopt an alternate scenario.

Sluices have been closed at Somerset and this will result in high upstream water levels affecting Kilcoy.

1. With no further rainfall, Wivenhoe will approach 75.0m AHD and there will be an attempt to limit the dam outflow to 4,500m³/s, however this strategy currently being reviewed on an hour by hour basis. The release will be 4,000m³/s by 1300.
2. With 50mm rainfall in the Stanley and Upper Brisbane in the next 12 to 24 hours, the release will need to be significantly increased to be in the order 6,000m³/s.

It should be noted that the flow in the lower Brisbane River in 1974 was about 9,500m³/s

Wivenhoe has lost incoming mains power and are on backup power. Energex are attempting to rectify.

North Pine

Inflows and outflows are increasing very rapid and will exceed 2,000m³/s.

APPENDIX E – SITUATION REPORTS

Situation Report 18

Date: Tuesday 11 January 2011

Time: 18:00

From: Duty Engineer

Sent: Tuesday, 11 January 2011 6:00 PM

To: Distribution List

Subject: Situation Report 1800 12 January 2011

In the last twelve hours totals of up to 370mm have fallen in the area around Wivenhoe Dam. In the last hour, rainfalls between 15 and 30mm have been recorded in the same area. At 1600, the BoM advised that falls between 50 to 100mm are still forecast for the 24hrs to 1600 Wednesday 12 January 2011 for the North Pine and Somerset/Wivenhoe catchments.

At 1730 Wivenhoe Dam was 74.92m AHD and rising slowly and releasing about 6,700m³/s.

The current expectation is that the dam will reach a steady state (outflow equals inflow) within the next 3 hours without further significant rainfall. At this time, release from the dam will be about 8,000 m³/s.

If there is no further rainfall, it may be possible to then slowly reduce this release overnight.

The dam is expected to peak below 75.5m AHD which is 100mmm below the first fuse plug initiation level.

Note that the automatic recorder as indicated on the BoM website is affected by drawdown and is not reflecting the actual lake level and tendency.

The Flood Operations Centre is continuing to monitor rainfalls and water levels through the Brisbane and Pine catchments and reviewing operating strategy every 30 minutes. The FOC is also maintaining close contact with warning agencies and local councils.

The next report will be issued at 2100 12 January 2011.

APPENDIX E – SITUATION REPORTS

Situation Report 19

Date: Wednesday 12 January 2011

Time: 05:49

From: Duty Engineer

Sent: Wednesday, 12 January 2011 5:49 AM

To: Distribution List

Subject: Situation Report 0600 Wed 12/01/2011

No significant rain has fallen over the catchments in the past twelve hours. Less than 10 to 15 millimeters of rainfall is expected over the next 24-48 hours.

Wivenhoe Dam peaked on the 11th January, Tuesday night at 19:00 at 74.97 mAHD with a corresponding discharge of 7,450 m³/s. The release have now been scaled back to 4,300m³/s at 05:00 am. Wivenhoe Dam is currently 74.77 m AHD and falling slowly.

The releases from Wivenhoe Dam will be temporarily reduced to 2,500 m³/s to allow the peak of Lockyer Creek to enter the Brisbane River, after which they will be increased to maximum of 3,500 m³/s. This release will then be maintained to drain the flood storage component within the required 7 days.

Somerset Dam is at 105.10 mAHD and slowly rising. The dam is discharging 1,230 m³/s over the spillway. The dam is expected to peak this morning near its current level. Sluice gates will be utilised to assist the draining of the flood storage compartment commencing on Thursday. The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2 million megalitres.

North Pine Dam is currently releasing 105 m³/s through five gates. At 17:00 the lake was 39.78 mAHD. The event has a volume of around 200,000 ML. The peak discharge from the dam was 2,800 m³/s. This is categorised as an extreme event in the order of 1 in 10,000.

The Flood Operations Centre is continuing to monitor rainfalls and water levels through the Brisbane and Pine catchments and reviewing operating strategy every 30 minutes. The FOC is also maintaining close contact with warning agencies and local councils.

The next report will be issued at 08:00 12 January 2011.

Time: 07:57

From: Duty Engineer

Sent: Wednesday, 12 January 2011 7:57 AM

To: Distribution List

Subject: RE: Situation Report 0800 Wed 12/01/2011

Rainfall

No significant rain has fallen over the catchments in the past twelve hours. Less than 10 to 15 millimeters of rainfall is expected over the next 24-48 hours.

Somerset/Wivenhoe

Somerset Dam has peaked at 105.11 mAHD at 06:00 on 12 January 2011 and the dam is discharging 1,230 m³/s over the spillway. Sluice gates will be utilised to assist the draining of the flood storage compartment commencing later Wednesday.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s. Wivenhoe Dam was 74.75 m AHD at 07:30 and generally falling slowly.

The releases from Wivenhoe Dam have been temporarily reduced to 2,500 m³/s at 07:30 to allow the peak of Lockyer Creek to enter the Brisbane River. After the downstream peak in the lower Brisbane River has passed, releases will be increased to maximum of 3,500 m³/s. This release will then be maintained to drain the flood storage component within the required 7 days.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2 million megalitres.

North Pine

At 07:00 North Pine Dam was 39.78 mAHD falling and releasing about 105 m³/s. North Pine has peaked at 41.11 mAHD at 14:00 on 11 January 1974 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML. It is expected that gates will be close later Wednesday or early Thursday.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels through the Brisbane and Pine catchments and reviewing operating strategy every 30 minutes. The FOC is maintaining close contact with warning agencies and local councils.

The next report will be issued at 12:00 12 January 2011.

Regards

Rainfall

Rainfall in the last 12 hours is generally below 5mm with a couple of 10mm falls in the Stanley and North Pine catchments. There is no significant rain expected in the next 4 days.

Somerset/Wivenhoe

Somerset Dam has peaked at 105.11 mAHD at 06:00 on 12 January 2011. One sluice was opened at 1030 12 January 2011 and the dam is discharging 1,440 m³/s. Sluice gates will be utilised to drain of the flood storage compartment during the next 5 days.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s. Wivenhoe Dam was 74.81 m AHD at 15:00 and steady.

The releases from Wivenhoe Dam have been temporarily reduced to 2,500 m³/s at 07:30 12 January 2011 to allow the peak of Lockyer Creek to enter the Brisbane River. After the downstream peak in the lower Brisbane River has passed, releases will be increased to maximum of 3,500 m³/s. This release will then be maintained to drain the flood storage component within the required 7 days.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2 million megalitres.

North Pine

At 15:00 North Pine Dam was 39.74 mAHD falling with all gates open 1 increment, releasing about 80 m³/s. North Pine peaked at 41.11 mAHD at 14:00 on 11 January 1974 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML. It is expected that gates will be closed on Thursday or Thursday.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels through the Brisbane and Pine catchments and reviewing operating strategy every 30 minutes. The FOC is maintaining close contact with warning agencies and local councils.

The next report will be issued at 18:00 12 January 2011.

Rainfall

Rainfall in the last 12 hours is generally below 5mm with a couple of 10mm falls in the Stanley and North Pine catchments. There is no significant rain expected in the next 4 days.

Somerset/Wivenhoe

Somerset Dam has peaked at 105.11 mAHD at 06:00 on 12 January 2011. One sluice was opened at 1030 12 January 2011. Somerset Dam was 104.87 mAHD at 1700 12 January 2011 and discharging 1,410 m³/s. Sluice gates will be utilised to drain of the flood storage compartment during the next 5 days.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s. Wivenhoe Dam was 74.82 m AHD at 17:00 and steady.

The release from Wivenhoe Dam was reduced to 2,500 m³/s at 07:30 12 January 2011 to allow the peak of Lockyer Creek to enter the Brisbane River and this release has been maintained since. After the downstream peak in the lower Brisbane River has passed, releases will be increased to maximum of 3,500 m³/s. The release is expected to commence Thursday and then be maintained at this level to drain the flood storage component within the required 7 days. The releases will not result in any renewed rises at downstream locations.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be 2.6 million megalitres.

North Pine

At 17:00 North Pine Dam was 39.74 mAHD steady with all gates open 1 increment, releasing about 80 m³/s. North Pine peaked at 41.11 mAHD at 14:00 on 11 January 1974 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML. It is expected that gates will be closed on Thursday or Friday.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels through the Brisbane and Pine catchments and reviewing operating strategy regularly. The FOC is maintaining close contact with warning agencies and local councils.

Subject: Situation Report 0600 13 January 2011

Rainfall

Rainfall in the last 12 hours is generally below 5mm with isolated falls of up to 15mm in the Stanley, Lockyer and Pine River catchments. There is no significant rain expected for the next 4 days.

Somerset/Wivenhoe

Somerset Dam peaked at 105.11 mAHD at 06:00 on Wednesday 12 January 2011. The current level is 104.34 mAHD. One sluice was opened at 10:30 on 12 January 2011 and the dam is currently discharging 1,130 m³/s. Sluice gates will be utilised to drain of the flood storage compartment during the next 5 days.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on Tuesday 11 January 2011 with a corresponding discharge of 7,450 m³/s. Wivenhoe Dam was 74.72 m AHD at 06:00 and commence to fall slowly.

The releases from Wivenhoe Dam have been temporarily reduced to 2,500 m³/s at 07:30 on Wednesday 12 January 2011 to allow the peak of Lockyer Creek to enter the Brisbane River. The Brisbane River has peaked at the Port Office Gauge early Thursday morning. Releases from Wivenhoe Dam will be managed to achieve a target flow of around 3,500 m³/s at Moggill. This release will then be maintained to drain the flood storage component within the required 7 days.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

North Pine

At 06:00 North Pine Dam was 39.70 mAHD falling with all gates open 1 increment, releasing about 80 m³/s. North Pine peaked at 41.11 mAHD at 14:00 on Tuesday 11 January 2011 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML. It is expected that all gates will be closed on Friday.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels throughout the Brisbane and Pine River catchments and reviewing operating strategy. The FOC will continue to maintain close contact with warning agencies and local councils.

The next report will be issued at 18:00 on Thursday 13 January 2011.

Rainfall

There has been no significant rainfall in the last 12 hours and none is expected for the next 5 days.

Somerset/Wivenhoe

Somerset Dam peaked at 105.11 mAHD at 18:00 on Wednesday 12 January 2011. The current level is 103.60 mAHD and falling. Four sluices are open and the dam is currently discharging 1,528 m³/s.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on Tuesday 11 January 2011 with a corresponding discharge of 7,450 m³/s. Wivenhoe Dam was 74.5 mAHD at 18:00 and continuing to fall slowly.

The releases from Wivenhoe Dam are currently 2,888 m³/s and are being managed to achieve a target flow of around 3,500 m³/s at Moggill. This release will then be maintained to drain the flood storage component within the required 7 days.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

North Pine

At 18:00 North Pine Dam was 39.60 mAHD and falling with 5 gates open, releasing about 151 m³/s. North Pine peaked at 41.11 mAHD at 14:00 on Tuesday 11 January 2011 with a peak release of 2,800 m³/s. The flood event volume is estimated to be around 200,000 ML.

All gates will be closed at 05:00 Friday to enable MMRC to consider reopening Youngs Crossing.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels throughout the Brisbane and Pine River catchments and reviewing operating strategy. The FOC will continue to maintain close contact with warning agencies and local councils.

The next report will be issued at 06:00 on Friday 14 January 2011.

Rainfall

There has been no significant rainfall in the last 12 hours and falls of only 5mm is expected in the next twenty-four hours. Mostly fine conditions are expected over the weekend, but showers will return early next week.

Somerset/Wivenhoe

Somerset Dam peaked at 105.11 mAHD at 18:00 on Wednesday 12 January 2011. The current level is 102.87 mAHD and falling. Four sluices are open and the dam is currently discharging about 1,300 m³/s.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on Tuesday 11 January 2011 with a corresponding discharge of 7,450 m³/s. At 05:00 Wivenhoe Dam was 74.74.08 mAHD and continuing to fall.

The releases from Wivenhoe Dam are currently about 3,500 m³/s and are being managed to achieve a target flow of around 3,500 m³/s at Moggill. This release will then be maintained to drain the flood storage component by Wednesday.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

North Pine

At 05:00 North Pine Dam was 39.40 mAHD and gate operations have ceased. The current level is expected to increase to just over 39.5 mAHD in the next few days due to base-flow. This could be higher if further rainfall occurs.

Fish recovery has commenced and MBRC have been advised that the gates have been closed. MBRC will inspect Youngs Crossing to determine if the crossing can be re-opened.

North Pine peaked at 41.11 mAHD at 14:00 on Tuesday 11 January 2011 with a peak release of 2,800 m³/s. The flood event volume is estimated to be around 200,000 ML.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels throughout the Brisbane and Pine River catchments. The FOC will continue to maintain close contact with warning agencies and local councils.

Rainfall

There has been no significant rainfall in the last 24 hours and no significant rainfall is expected in the next twenty-four hours. Mostly fine conditions are expected over the weekend, but showers will return early next week.

Somerset/Wivenhoe

At 16:00 Somerset Dam was 99.02 mAHD and steady. The last sluice gate was closed at 7:00 17/01/2011 and one regulator was opened the base-flow into the Dam. Somerset Dam peaked at 105.11 mAHD at 18:00 on Wednesday 12 January 2011.

At 16:00 Wivenhoe Dam was 68.66 mAHD and continuing to fall. The releases from Wivenhoe Dam are currently about 2946 m³/s. Releases will be steadily reduced before final closure on Thursday morning. The Dam will be near full supply and releases will be made through the regulator to account for ongoing base-flow.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on Tuesday 11 January 2011 with a corresponding discharge of 7,450 m³/s.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

It should be noted that the automatic recorder currently being reported on the BoM website is currently incorrect and has been since early Tuesday 11 2011.

North Pine

At 09:00 North Pine Dam was 39.5 mAHD. All gates are closed. No further gate operations are expected unless additional rainfall falls.

North Pine peaked at 41.11 mAHD at 14:00 on Tuesday 11 January 2011 with a peak release of 2,800 m³/s. The flood event volume is estimated to be around 200,000 ML.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels throughout the Brisbane and Pine River catchments and is maintaining close contact with warning agencies and local councils. Councils have been informed of the current release strategy. The bridges below Wivenhoe Dam will progressively come out of water over the next few days.

APPENDIX E – SITUATION REPORTS

Situation Report 29

Date: Tuesday 18 January 2011

Time: 06:17

From: Duty Engineer

Sent: Tuesday, 18 January 2011 6:17 AM

To: Distribution List

Subject: Situation Report 0615 Tuesday 18 January 2011

Rainfall

There has been no significant rainfall in the last 24 hours and no significant rainfall is expected in the next twenty-four hours. Mostly fine conditions are expected over the weekend, but showers will return early next week.

Somerset/Wivenhoe

At 16:00 Monday Somerset Dam was 99.02 mAHD and steady. The last sluice gate was closed at 07:00 17/01/2011 and one regulator remains open managing the base-flow into the Dam. Somerset Dam peaked at 105.11 mAHD at 18:00 on Wednesday 12 January 2011.

At 06:00 Tuesday Wivenhoe Dam was 67.82 mAHD and continuing to fall slowly. Releases were held constant overnight at about 2,050 m³/s to assist water supply pumping at Lowood. Following discussions with water supply operators, it has been decided to resume closing gates at 09:00 Tuesday before final closure on Thursday morning. The Dam will be near full supply and releases will be made through the regulator to account for ongoing base-flow.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on Tuesday 11 January 2011 with a corresponding discharge of 7,450 m³/s.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

It should be noted that the Seqwater water level gauge currently being reported on the BoM website is currently slightly under reading by about 50mm.

North Pine

At 09:00 North Pine Dam was 39.5 mAHD. All gates are closed. No further gate operations are expected unless additional rainfall falls.

North Pine peaked at 41.11 mAHD at 14:00 on Tuesday 11 January 2011 with a peak release of 2,800 m³/s. The flood event volume is estimated to be around 200,000 ML.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels throughout the Brisbane and Pine River catchments and is maintaining close contact with warning agencies and local councils. Councils have been informed of the current release strategy.

APPENDIX E – SITUATION REPORTS

At 05:00, the Wivenhoe Dam operator reported that the Fernvale Bridge was out of water but water remained over the approaches from Fernvale. He also advised that there were power lines on the bridge and that Energex was advised.

The remaining bridges below Wivenhoe Dam will progressively come out of water over the next few days.

APPENDIX E – SITUATION REPORTS

Situation Report 30

Date: Tuesday 18 January 2011

Time: 17:40

From: Duty Engineer

Sent: Tuesday, 18 January 2011 5:40 PM

To: Distribution List

Cc: Distribution List

Subject: FOC Situation Report at 18:00 on Tuesday 18 January 2011

Rainfall

Severe thunderstorms are passing over Wivenhoe, Somerset and North Pine Dams this afternoon. To 17:00 falls of 20 to 30 mm were recorded at isolated locations including Mt Pechey and Klivers Lookout.

A severe thunderstorm warning remains in place for the Stanley River Valley near Kilcoy.

Somerset/Wivenhoe

At 16:00 Tuesday Somerset Dam was 98.95 mAHD and steady. The last sluice gate was closed at 07:00 17/01/2011 and one regulator remains open managing the base-flow into the Dam. Somerset Dam peaked at 105.11 mAHD at 18:00 on Wednesday 12 January 2011.

At 16:00 Tuesday Wivenhoe Dam was 66.31 mAHD and continuing to fall slowly.

Releases were held constant since 15:00 at about 1,450 m³/s to assist water supply pumping at Lowood. The shutdown sequence is scheduled to re-commence at 03:00 on Wednesday 19 January 2011 morning before final closure on Thursday morning. The Dam will be lowered to 66.5 mAHD (95% capacity) and releases will be made through the regulator to account for ongoing base-flow.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on Tuesday 11 January 2011 with a corresponding discharge of 7,450 m³/s.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

It should be noted that the Seqwater water level gauge currently being reported on the BoM website is currently slightly under reading by about 50mm.

North Pine

At 09:00 North Pine Dam was 39.56 mAHD and rising slowly. All gates are closed. No further gate operations are expected unless additional rainfall falls. This situation will be closely monitored whilst storms remain in the vicinity.

North Pine peaked at 41.11 mAHD at 14:00 on Tuesday 11 January 2011 with a peak release of 2,800 m³/s. The flood event volume is estimated to be around 200,000 ML.

APPENDIX E – SITUATION REPORTS

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels throughout the Brisbane and Pine River catchments and is maintaining close contact with warning agencies and local councils. Councils have been informed of the current release strategy.

The remaining bridges below Wivenhoe Dam will progressively come out of water over the next few days.

Regards

APPENDIX E – SITUATION REPORTS

Situation Report 31

Date: Wednesday 19 January 2011

Time: 05:28

From: Duty Engineer

Sent: Wednesday, 19 January 2011 5:28 AM

To: Distribution List

Cc: Distribution List)

Subject: FOC Situation Report at 06:00 on Wednesday 19 January 2011

Rainfall

Severe thunderstorms passed over the Wivenhoe, Somerset and North Pine dam catchments yesterday afternoon and evening. Falls of 20mm to 30mm were recorded at isolated locations.

North Pine

A decision was made at 1900 yesterday to drain the dam down to 39.40m AHD overnight to cater for the inflow resulting from yesterday's storms and ensure that Youngs Crossing remains open during the day today. All gates were closed at 0500 today and a fish recovery operation also commenced at this time. Youngs Crossing will be reopened by the MBRC at around 0700. The dam level will rise slowly during the day and further releases may be required again tonight with more rainfall forecast. The current lake level is 39.42m AHD.

Somerset Dam

All regulators were closed at 2000 yesterday. The dam level is currently 98.95m AHD and rising slowly. Further regulator releases will take place today and again over the next few days to maintain the dam at the full supply level. Somerset Dam peaked at 105.11 mAHD at 18:00 on Wednesday 12 January 2011; all sluice gates were closed on Monday 17 January 2011.

Wivenhoe Dam

The Lowood temporary pump station was relocated at 2100 yesterday. This relocation removed the need to continue high flow releases from the dam to ensure treated water supplies to Lowood are maintained. Discussions with BCC last night also concluded that tidal variations are primarily back to normal patterns and having a greater impact on the foundation conditions of Coronation Drive than the tapering of releases from the dam. Accordingly the radial gate close down sequence recommenced at 21:45 last night and all gates will be closed by 1600 today. The dam level when the last gate is closed will be around 66.90m AHD and a fish recovery operation will continue through most of the day during the close down sequence. Releases will continue through the regulator cone valve and possibly the Mini-Hydro (depending on when it can be re-started) to account for ongoing base-flow once all radial gates are closed.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on Tuesday 11 January 2011 with a corresponding discharge of 7,450 m³/s. The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres. It should be

APPENDIX E – SITUATION REPORTS

noted that the Seqwater water level gauge currently being reported on the BoM website is currently slightly under reading by about 50mm.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels throughout the Brisbane and Pine River catchments and is maintaining close contact with warning agencies and local councils. Councils have been informed of the current release strategy. A summary of the bridge status along the Brisbane River between Wivenhoe Dam and Moggill is as follows, with the exact timing of water coming clear of bridges depending on how the radial gate close down sequence progresses during the day:

- Water is clear of Fernvale Bridge and Mt Crosby Weir Bridge.
- Water should be clear of Burtons Bridge, Kholo Bridge and Savages Crossing tonight.
- Water should be clear of Colleges Crossing tomorrow.
- It is not yet certain when water will be clear of Twin Bridges as this will depend on base flow draining requirements and a decision will be made on this later today. The earliest that Twin Bridges would be clear of water is late this afternoon.

APPENDIX E – SITUATION REPORTS

Situation Report 32

Date: Wednesday 19 January 2011

Time: 13:45

From: Duty Engineer

Sent: Wednesday, 19 January 2011 1:45 PM

To: Distribution List

Subject: Situation Report 1345 Wednesday 2011

Rainfall

No significant rainfall has been recorded in Wivenhoe, Somerset and North Pine dam catchments since 0900 Thursday. The forecast rainfall indicates that falls between 15 to 25mm with isolated heavier falls to 50mm are expected in the next 24 hours.

North Pine

A decision was made at 1900 Wednesday to drain the dam down to 39.40m AHD overnight to cater for the inflow resulting from Wednesday's storms and ensure that Youngs Crossing remains open during the day Thursday. All gates were closed at 0500 Thursday and a fish recovery operation also commenced at this time. Youngs Crossing was expected to be reopened by the MBRC at around 0700. The dam level will rise slowly during the day and further releases may be required again tonight with more rainfall forecast. The lake level was 39.43m AHD at 0700.

Somerset Dam

All regulators were closed at 2000 Wednesday. The dam level was 99.00 m AHD at 0700 Thursday and rising slowly. Further regulator releases may take place over the next few days to maintain the dam at the full supply level. Somerset Dam peaked at 105.11 mAHD at 18:00 on Wednesday 12 January 2011; all sluice gates were closed on Monday 17 January 2011.

Wivenhoe Dam

All gates were closed at Wivenhoe at 1200 Thursday, with the dam level at 66.89m AHD at 1300. Following fish recovery and inspections, minor ongoing releases will be made for through the centre gate to account for ongoing small inflows. It is intended to drain down to 95%, approximately 66.5 m AHD.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on Tuesday 11 January 2011 with a corresponding discharge of 7,450 m³/s. The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

Strategy

A summary of the bridge status along the Brisbane River between Wivenhoe Dam and Moggill is as follows, with the exact timing of water coming clear of bridges depending on how the radial gate close down sequence progresses during the day:

- Water is clear of Fernvale Bridge and Mt Crosby Weir Bridge.

APPENDIX E – SITUATION REPORTS

- Water should be clear of Burtons Bridge, Kholo Bridge and Savages Crossing tonight.
- Water should be clear of Colleges Crossing tomorrow.
- It is not yet certain when water will be clear of Twin Bridges as this will depend on base flow draining requirements and a decision will be made on this later Thursday.

The Flood Operations Centre is now closed and control of the dams has reverted to normal Seqwater operations. However, the FOC will continue to monitor rainfalls and water levels throughout the Brisbane and Pine River catchments.

Engineer 2
Duty Engineer

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 1

Date: Monday 27 December 2010

Time: 08:14

The Flood Centre will keep you informed or leave messages on your phones.

Below is the current strategy.
Any comments or assessments let me know.

Rainfall

Reasonably significant rainfalls in the order of 40 to 50 mm have been experienced in the dam catchments in the last 24 hours, but the rainfall has only been in the order of 5 to 10mm in the last 6 hours. The QPF issued at 1600 yesterday was for 50 to 100mm and the severe weather warning associated with possible widespread rainfall in the dam catchments remains current and was re-issued by BOM at 0445 today. The current BOM forecast is:

Monday 27 December Rain periods
Tuesday 28 December Rain at times
Wednesday 29 December Rain at times
Thursday 30 December Shower or two
Friday 31 December Fine
Saturday 31 December Fine
Sunday 1 January Fine

With the current wet catchments, there is a high probability that the forecast rain will result in further flood releases from the dams over the coming week.

Somerset Dam

Two regulators were opened yesterday morning, to provide a release of 12000ML/day. Since that time the lake has continued to rise steadily to currently be around 99.60m or 600mm above the full supply level. Another regulator was opened this morning. Further gate operations may be necessary today if forecast rainfall results in subsequent river rises. Draining will take at least until Wednesday. The next update will be provided at around 1200 today.

Currently at 107.7% with 30,000ML over FSL.

Wivenhoe Dam

Radial Gate operations recommenced yesterday at 0900 and since that time the lake has risen steadily to currently be around 67.57m or 570mm above the full supply level. Because of outflows from Lockyer Creek, outflows from Wivenhoe Dam have been steadily reduced during the night to ensure Burtons Bridge remained open (current river levels have water at Burtons Bridge deck level and falling slowly). Radial gates at Wivenhoe Dam are being progressively wound back this morning as the Lockyer Creek outflows into the Brisbane River increase above 250 cumecs. This will keep Burtons Bridge open until late this afternoon. However it is anticipated that Lockyer Creek

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

outflows will peak above 500 cumecs later today or early tomorrow and these flows will inundate Burtons Bridge. As this occurs, outflows from Wivenhoe Dam will be increased to drain the lake to near full supply level. Draining will take at least until Thursday. Further gate operations may be necessary in coming days if forecast rainfall results in subsequent river rises.

Wivenhoe is around 105.6% and 65,000ML over FSL.

Impacts of Wivenhoe Dam Releases

Twin Bridges, Savages Crossing and Colleges Crossing are currently closed and will remain so until at least Thursday. Burtons Bridge is currently open, but will be closed late today or early tomorrow and is likely to remain closed until at least Wednesday. However, the length of time that Burtons Bridge will be closed is dependant upon the rainfall experienced over the next several days. Kholo Bridge remains unserviceable due to flood damage. There is no current expectation that either Mt Crosby Weir Bridge or Fernvale Bridge will be impacted by the current event.

An updated estimate of the time of closure of Burtons Bridge this afternoon will be provided to Council, but at this stage it is not expected to be before 1600 today. This may change as rainfall is experienced during the day.

Tide levels in Brisbane are decreasing generally so Wivenhoe releases should have minimal impact.

Dam Operations Manager
Water Delivery
Queensland Bulk Water Supply Authority *trading as Seqwater*

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 2

Date: Tuesday 28 December 2010

Time: 07:12

The Flood Centre will keep you informed or leave messages on your phones.

Below is the current strategy.
Any comments or assessments let me know.

Basically with all the rain in the Lockyer we have not ramped up until it peaks and starts to drop to ensure there is no impact on Fernvale or Mt Crosby bridges.
This should still be later today as the Lockyer starts to drop.

Rainfall

Rainfalls in the order of 20 to 40 mm have been experienced in the dam catchments in the last 24 hours, but the rainfall has only been in the order of 5 mm in the last 12 hours. The QPF issued at 1600 yesterday was reduced to 25 to 35mm and the severe weather warning associated with possible widespread rainfall in the dam catchments is no longer current. The current BOM forecast is:

Tuesday 28 December Shower or two.
Wednesday 29 December Shower or two.
Thursday 30 December Fine.
Friday 31 December Fine
Saturday 31 December Mostly Fine
Sunday 1 January Few showers
Monday 27 December Showers

Although the dam catchments are saturated, BOM forecasts are currently indicating that dam inflows have peaked for the current event.

North Pine Dam – Just FYI

A flood release commenced at 2000 on Sunday 26 December 2010 and is now likely to continue until 0500 on Wednesday 29 December 2010 (tomorrow morning). This will allow Youngs Crossing to reopen by 0700 on Wednesday. Current outflows from Lake Kurwongbah would also be sufficient to inundate Youngs Crossing, regardless of releases from North Pine Dam, but these outflows should also subside by Wednesday morning.
The current level in North Pine Dam is around 39.72 m AHD and falling, with all gates currently open. The situation will be reviewed throughout today, with the next update to be provided at around 1600 today.

Somerset Dam

A flood release through the regulator cone valves at the dam commenced at 0900 on Sunday 26 December 2010. The current release rate is 18000ML/day. Since commencing the release the lake has continued to rise steadily to currently be around 99.96m AHD or 960mm above the full supply level. Inflows into the dam are subsiding and unless further rainfall in the dam catchment is experienced, the lake will soon start to

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

fall slowly to be back near the dam full supply level by Thursday. Sluice gate operations will commence this morning as Wivenhoe levels are approaching the point at which the regulator cone valves should not be used due to back water impacts. The total volume of water released since the release commenced on 26 December 2010 is 37,000ML, with the current projected total release volume for this event being 80,000ML.

Wivenhoe Dam

Radial Gate operations for the current event commenced at 0900 on Sunday 26 December 2010. After scaling up to an initial release rate of 30,000ML/day, the release was scaled back yesterday to the minimum radial gate release rate of 4,000ML/day to ensure that Burtons Bridge remained open until yesterday afternoon and to reduce flooding impacts in the Brisbane River caused by outflows into the river from Lockyer Creek. The current release rate remains at 4,000ML/day, but will be scaled up later today as Lockyer Creek flows subside. The current lake level is 68.55m AHD or 1550mm above the full supply level. Inflows into the dam are subsiding and unless further rainfall in the dam catchment is experienced, the lake will fall slowly once the release rate is scaled up, for the level to be back near the dam full supply level by around Sunday. The total volume of water released since the release commenced on 26 December 2010 is 28,000ML, with the current projected total release volume for this event being in the order of 375,000ML (includes inflows from Somerset Dam).

Impacts of Wivenhoe Dam Releases

Twin Bridges, Savages Crossing, Colleges Crossing, Burtons Bridge and Kholo Bridge are currently closed and will remain so until at least Friday. There is no current expectation that either Mt Crosby Weir Bridge or Fernvale Bridge will be impacted by the current event, but Lockyer Creek outflows are being closely monitored and will come close to impacting upon the Mt Crosby Weir Bridge. An updated estimate of the likely time of opening of Burtons Bridge will be provided tomorrow.

Tide levels in Brisbane are decreasing generally so Wivenhoe releases should have minimal impact. BoM advice confirms this. Impacts from Bremer and other inflows should have mostly passed by the time any release from Wivenhoe gets to downstream river reaches.

Dam Operations Manager
Water Delivery
Queensland Bulk Water Supply Authority *trading as Seqwater*

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 3

Date: Wednesday 29 December 2010

Time: 07:16

The Flood Centre will keep you informed or leave messages on your phones.

Below is the current strategy.
Any comments or assessments let me know.

Rainfall

No rainfall has fallen in the past 12 hours to 0600 Wednesday with the exception of 2-4 mm in the upper Somerset Dam catchment.
The rainfall forecast issued by BOM at 1600 Tuesday indicated only 3-5 mm in the Somerset and Wivenhoe catchments and 5-10mm in the North Pine catchment for the next 24 hours. The current BOM forecast for SE Qld over the next few days is mostly fine with a few showers

However, catchments remain saturated and are primed for additional runoff in the event of rain.

Somerset Dam

A flood release through the regulator cone valves at the dam commenced at 0900 on Sunday 26 December 2010. Early Tuesday the regulators were closed and sluices progressively opened throughout the day. At 1800 Tuesday 2 sluices were open, releasing about 35,000 ML/day into Wivenhoe. A further two sluice gates were opened overnight in an attempt to bring the lake level down to 99.75 to enable recreational use of Somerset water activities to resume on Wednesday. At 1800, the lake level was 99.83m AHD and falling slowly. Two sluice gates will be closed by 12:00 29/12/2010 and two sluice gates are expected to remain open until Thursday and will be closed when the lake returns to the full supply level of 99m AHD. The total volume of water released since the event commenced on 26 December 2010 is 66,000ML, with the current projected total release volume for this event approaching 110,000ML.

Wivenhoe Dam

Radial gate operations for the current event commenced at 0900 on Sunday 26 December 2010. After scaling up to an initial release rate of 30,000ML/day, the release was scaled back Monday to the minimum radial gate release rate of 4,000ML/day to ensure that Burtons Bridge remained open and to reduce flooding impacts in the Brisbane River caused by flows from Lockyer Creek. Lockyer Ck outflow peaked at midday Tuesday and Wivenhoe gates were commenced to be re-opened at 1500 Tuesday, releasing on the back of the Lockyer recession. It is intended to gradually increase the Wivenhoe releases during Tuesday and Wednesday so that the combined release and Lockyer flow is maintained at about 1600m³/s (140,000 ML/day) in the mid Brisbane R. Note this is similar to the flows in the mid Brisbane in mid October and mid December 2010. This will be maintained until at least Saturday when it is expected that shut down procedure will commence. Gate closure sequencing will be such that the releases will mimic the natural pre-dam flows.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

At 0600, the Wivenhoe water level was 69.26m AHD and rising slowly with the current release rate at 60,000ML/day. Inflows into the dam are subsiding and the lake will fall slowly once the release rate is scaled up 130,000 ML/day during Wednesday. It is aimed to return the dam to full supply level by Sunday. The total volume of water released since the event commenced on 26 December 2010 is 56,000ML, with the current projected total release volume for this event being in the order of 385,000ML (includes inflows from Somerset Dam).

Impacts of Wivenhoe Dam Releases

Twin Bridges, Savages Crossing, Colleges Crossing, Burtons Bridge and Kholo Bridge are currently closed and will remain so until at least Sunday. There is no current expectation that either Mt Crosby Weir Bridge or Fernvale Bridge will be impacted by the current event. At this stage, it is estimated that the flow at Burtons Bridge will fall below the bridge deck on Sunday morning.

Tide levels in Brisbane are decreasing generally so Wivenhoe releases should have minimal impact. BoM advice confirms this. Impacts from Bremer and other inflows should have mostly passed by the time any release from Wivenhoe gets to downstream river reaches.

Water Delivery
Queensland Bulk Water Supply Authority *trading as Seqwater*

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 4

Date: Thursday 30 December 2010

Time: 07:03

The Flood Centre will keep you informed or leave messages on your phones.

Below is the current strategy.
Any comments or assessments let me know.

Rainfall

There has been no significant rainfall in the North Pine, Somerset and Wivenhoe catchments since 09:00 on Wednesday 29 December 2010. The current BOM forecast for SE Qld over the next few days is mostly fine with a few light showers, although there is a chance of storms on Tuesday and Wednesday next week.

The catchments remain saturated and are primed for additional runoff in the event of rain.

Somerset Dam

At 06:00 Thursday 30 December 2010, two sluices remain open, releasing about 35,000 ML/d into Lake Wivenhoe and are expected to remain open until Thursday afternoon when the lake returns to the full supply level of 99.00m AHD. The total volume of water released since the event commenced on 26 December 2010 is 104,000ML, with the current projected total release volume for this event approaching 123,000ML.

Wivenhoe Dam

Releases were gradually increased during Wednesday and Thursday morning until the combined release and Lockyer flow reached about 1,600m³/s (140,000 ML/d) in the middle Brisbane River. (Note this is similar to the flows in the releases made in mid-October and earlier in December 2010). This release will be maintained until mid-day Friday 31 December 2010, when the shut down procedure will commence and gates are expected to be fully closed by Sunday morning 2 January 2010. The proposed gate closure sequence will be such that the releases will mimic the natural pre-dam recessional flows.

Gauge board readings indicate that the Wivenhoe dam water level peaked at 69.33m at noon Wednesday 29 December 2010, about 2.3m above the full supply level. At this level, the dam was temporarily storing over 270,000ML of flood water. At 06:00 on Thursday 30 December 2010, the level had fallen slightly to 69.07m AHD and was releasing about 1,530m³/s (132,000ML/d). The total volume of water released from Wivenhoe dam since the event commenced on 26 December 2010 is 160,000ML, with the current projected total release volume for this event being in the order of 425,000ML (includes inflows from Somerset Dam).

Impacts of Wivenhoe Dam Releases

Twin Bridges, Savages Crossing, Colleges Crossing, Burtons Bridge and Kholo Bridge are currently closed due to inundation and will remain so until at least Sunday 2 January

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

2011. There is no current expectation that either Mt Crosby Weir Bridge or Fernvale Bridge will be impacted by this event. At this stage, it is estimated that the flow at Burtons Bridge will fall below the bridge deck on Sunday morning.

Wivenhoe releases should have minimal impact on tides based on planned releases. BoM advice confirmed this earlier in the week. Impacts from Bremer and other inflows should have mostly passed by the time any release from Wivenhoe gets to downstream river reaches.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 5

Date: Friday 31 December 2010

Time: 06:51

The Flood Centre will keep you informed or leave messages on your phones of any issues or major changes.

Below is the current strategy.
Any comments or assessments let me know.

Rainfall

There has been no significant rainfall in the North Pine, Somerset and Wivenhoe catchments since 0900 on Wednesday 29 December 2010. The current BOM forecast for SE Qld over the next few days is mostly fine with a few light showers, although there is a chance of storms on Tuesday and Wednesday next week.

The catchments remain wet and are likely to generate additional runoff in the event of rain.

Somerset Dam

At 0500 on Friday 31 December 2010, the lake level was 99.01m AHD falling from a peak of 100.0m AHD reached around noon Tuesday 28 December 2010. Two regulators are currently operating and will remain open until the lake returns to the full supply level of 99.00m AHD. The total volume of water released since the event commenced on 26 December 2010 is 126,000 ML, with the current projected total release volume for this event approaching 130,000ML.

Wivenhoe Dam

Releases were gradually increased during Wednesday and Thursday morning until the combined release and Lockyer flow reached about 1,600m³/s (140,000 ML/d) in the middle Brisbane River. (Note this is similar to the flows in the releases made in mid-October and earlier in December 2010). Flow measurement carried out by the Department of Environment and Heritage during Thursday has confirmed this flow. This release will be maintained until late Friday 31 December 2010, when the shut down procedure will commence and gates are expected to be fully closed by Sunday 2 January 2010. The proposed gate closure sequence will be such that the releases will mimic the natural pre-dam recessional flows.

Gauge board readings indicate that the Wivenhoe dam water level peaked at 69.33m at noon Wednesday 29 December 2010, about 2.3m above the full supply level. At this level, the dam was temporarily storing over 270,000ML of flood water. At 0500 on Friday 31 December 2010, the level had fallen slightly to 68.40m AHD and was releasing about 1,550m³/s (132,000ML/d). The total volume of water released from Wivenhoe dam since the event commenced on 26 December 2010 is 293,000ML, with the current projected total release volume for this event being in the order of 450,000ML (includes inflows from Somerset Dam).

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Impacts of Wivenhoe Dam Releases

Twin Bridges, Savages Crossing, Colleges Crossing, Burtons Bridge and Kholo Bridge are currently closed due to inundation and will remain so until at least Sunday 2 January 2011. There is no current expectation that either Mt Crosby Weir Bridge or Fernvale Bridge will be impacted by this event. At this stage, it is estimated that the flow at Burtons Bridge will fall below the bridge deck on Sunday morning.

Wivenhoe releases should have minimal impact on tides based on planned releases. BoM advice confirmed this earlier in the week. Impacts from Bremer and other inflows should have mostly passed by the time any release from Wivenhoe gets to downstream river reaches.

Dam Operations Manager
Water Delivery
Queensland Bulk Water Supply Authority *trading as Seqwater*

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 6

Date: Sunday 2 January 2011

Time: 09:37

This is the last update.
Let me know of any issues.

Many thanks for everyone's support.

Rainfall

There has been light falls of up to 30mm in the North Pine and Somerset Dam catchments in the 24 hours to 06:00 Sunday 2 January 2011 which has resulted in some runoff in the Stanley and Pine Rivers. The current BOM forecast for SE Qld over the next week is for light showers, although there is a chance of storms on Wednesday and Thursday next week.

The catchments remain wet and are likely to generate additional runoff in the event of rain.

Somerset Dam

The rain in the Stanley River catchment has produced minor inflows and one regulator is partially open, managing the small inflows.

At 07:30 on Sunday 2 January 2010, the lake level was EL 99.10m AHD and rising slowly. The peak of the event occurred around noon on Tuesday 28 December 2010 with a level of EL 100.0 m. The total volume of water released since the event commenced on 26 December 2010 is 135,000 ML.

Wivenhoe Dam

At 09:00 on Sunday 2 January 2011, Wivenhoe Dam level was EL 67.10 m and gates are fully closed and fish recovery has commenced. Upon completion of this operation, a regulator will be fully opened to manage continuing low inflows to the dam.

The total volume of water released from Wivenhoe dam since the event commenced on 26 December 2010 is 480,000ML (includes inflows from Somerset Dam).

Impacts of Wivenhoe Dam Releases

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the closure.

It is expected that the flow in the mid Brisbane R will fall below Burtons Bridge on Sunday morning and below Colleges Crossing by Monday morning. Twin Bridge will continue to be impact by the continuing low releases for several days.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 7

Date: Thursday 6 January 2011

Time: 12:16

The Flood Centre will keep you informed or leave messages on your phones.

Below is the current strategy.
Any comments or assessments let me know.

Rainfall

Since 9am Wednesday, there have been widespread falls of 30mm with isolated heavy falls up to 50mm in the Somerset and Wivenhoe catchments. Totals in the North Pine catchment have generally been below 10mm. Falls up to 60mm were recorded in the Leslie Harrison catchment.

The forecast for the next 24 to 48 hours is for totals up to 150mm in SE Qld.

The catchments remain wet and are likely to generate additional runoff in the event of rain.

North Pine Dam

At 0700 Thursday, North Pine Dam was 39.60m, 0.05m below gate trigger level and having risen 0.18m since 2/1/2011 due to a combination of baseflow and runoff from rain in the last 24 hours.

Given the forecast rain, gate operations will commence tonight. MBRC will be advised this morning

Somerset Dam

At 0700 Thursday, Somerset Dam was 99.34m, 0.34m above FSL, and rising slowly. The rain in the Stanley River catchment has produced a small amount of runoff in the upper Stanley but there have been significant rises in Kilcoy Ck. Further regulator operations will be required later Thursday.

Wivenhoe Dam

At 0700 Thursday, Wivenhoe Dam was 67.31m and rising slowly. This is 0.31m above FSL and above the gate trigger level of 67.25m. There have been rises recorded at rivers and stream upstream of Wivenhoe Dam. Gates will be opened in the next 24 hours to manage the inflows from the upper Brisbane River and the outflow from Somerset.

Impacts of Wivenhoe Dam Releases

Based upon rain to date, expecting about 70,000ML from upper Brisbane. Lockyer Ck peak of about 100m³/s Friday afternoon. This will take out Twin Bridges and nearly inundate Savages Crossing. Colleges Crossing could be taken out by a combined Lockyer and local runoff.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Current strategy is to keep Burton Bridge free. On this basis, we will commence opening Wivenhoe at 1800 Thursday and ramp up to about 300m³/s by 2200. This would limit mid Brisbane flows to just under 400m³/s (Burtons capacity 450m³/s).

If rainfall increases and Lockyer and local runoff also increase, we can close/reduce Wivenhoe accordingly to ensure that that 450m³/s is not exceeded unless necessary.

Councils have been advised of this strategy and are contacting residents

Dam Operations Manager
Water Delivery
Queensland Bulk Water Supply Authority *trading as Seqwater*

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 8

Date: Saturday 8 January 2011

Time: 07:51

The Flood Centre will keep you informed or leave messages on your phones. Give them a call if you need further information.

Below is the current strategy.
Any comments or assessments let me know.

Rainfall

Since 0900 Friday, there has been widespread 20 to 40mm throughout North Pine, Somerset and Wivenhoe catchments with isolated higher totals of 70mm in the upper reaches of the Brisbane R. No significant rain has fallen in the past 12 hours.

Advice from BoM indicates that SE Qld can expect further high rainfall totals over the next 4 days.

Saturday: Rain light at times 5-50mm with higher falls along the coast
Sunday: Widespread rain with totals between 50-100mm
Monday: Widespread rain again with totals between 50-100mm
Tuesday: Rain easing with totals between 25-50mm

Given the saturated conditions of the catchments, significant inflows to Seqwater dams will be generated, especially following the forecast rainfall on Sunday/Monday.

North Pine (Full Supply Level 39.60 m AHD)

At 0600 Saturday, North Pine Lake Level was 39.46 m AHD and slowly rising. Currently 3 gates are open to release runoff from rain on Wed/Thursday/Friday. Given the very high likelihood of significant runoff during the next 4 days, gates will be kept open to match inflows over the next few days, rather than opening and closing at various times with short notice. Youngs Crossing will remain adversely impacted for the duration of the gates being open. Moreton Bay Regional Council has been advised and concurs with this strategy.

Somerset (Full Supply Level 99.00 m AHD)

At 0500 Saturday, Somerset Dam level was 100.42m AHD and rising. The Dam is releasing into Wivenhoe through one open sluice gate. Water will be temporarily held in Somerset to allow the inflow from the upper Brisbane to be passed through the system. However, this strategy may need to be reviewed if significant runoff occurs in the Stanley and Upper Brisbane. Under circumstances of high inflows to Somerset and Wivenhoe, it is the usual practice to hold flood water in Somerset until there is a high level of confidence in the estimated inflows to Wivenhoe.

Since the commencement of the event on 02/01/2011, approximately 85,000ML has flowed into Somerset Dam with a further 20,000ML expected based on the recorded rainfall to date. Approximately 25,000ML has been released into Wivenhoe.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Wivenhoe (Full Supply Level 67.00 m AHD)

At 0600 Saturday, Wivenhoe Dam was 68.45 m AHD and rising steadily with all five gates open and releasing about 890 m³/s. River levels upstream of Wivenhoe Dam were rising again, generating further inflow to the dam. It is intended to ramp up the release from Wivenhoe to 1,200m³/s by midday Saturday 08/01/2011. Further assessments will be undertaken to determine increases above this level. However, given the high likelihood of significant inflows in the next week, this may be increased.

Since the commencement of the event on 02/01/2011, approximately 200,000ML has flowed into Wivenhoe Dam (including Somerset releases) with a further 180,000ML expected based on the recorded rainfall to date. Approximately 50,000ML has been released from Wivenhoe via the hydro and regulator at about 50m³/s.

Impacts downstream of Wivenhoe

The projected Wivenhoe release of 1,200m³/s combined with Lockyer flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Savages Crossing, Burtons Bridge, Kholo Bridge and Colleges Crossing) will be adversely impacted for several days. At this stage Fernvale and Mt Crosby Weir Bridge are not expected to be affected but they could potentially be affected if the predicted rainfall totals eventuate.

The current available assessments indicate that the combined flow in the lower Brisbane R would only add 50mm to an upper limit of 100mm to the recorded water levels in the City Reach of the Brisbane River. However, it is noted that tides in the lower Brisbane R will be 0.4 to 0.5 metres higher than predicted tides.

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the Wivenhoe operating strategy.

Dam Operations Manager
Water Delivery
Queensland Bulk Water Supply Authority *trading as Seqwater*

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 9

Date: Sunday 9 January 2011

Time: 07:32

The Flood Centre will keep you informed or leave messages on your phones. Give them a call if you need further information.

Below is the current strategy.
Any comments or assessments let me know.

Rainfall

Catchment average rainfall for the past 12 hours is; North Pine Dam (less than 10 mm); Somerset Dam (40 mm); Wivenhoe Dam (less than 10 mm). The bulk of the rain that has fallen in the Somerset Dam catchment has occurred in the last two hours, with recorded falls exceeding 60mm in some areas. The BOM forecast for the next seven days issued at 0450 this morning is:-

Sunday:	Rain periods.
Monday:	Rain periods.
Tuesday:	Rain periods.
Wednesday	A few showers.
Thursday	A shower or two.
Friday	A shower or two.
Saturday	Mostly fine.

A severe weather warning remains current for heavy rainfall in the dam catchment areas. The dam catchments are relatively saturated and significant inflows will be generated if the forecast rainfall eventuates.

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level is currently 39.47 m AHD and steady. Two radial gates remain open to release runoff generated from recent rainfall. Based on rainfall forecasts, the radial gates have been kept open in anticipation of further inflows over the next few days. However unless significant rain falls today, consideration will be given to closing the gates late this afternoon or early tomorrow morning and discussions to finalise a decision on the timing of radial gate closure will be held with the Moreton Bay Regional Council later today. Youngs crossing will remain closed while releases are in progress.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is currently falling slowly, with the current level being 100.27m AHD. However the rain that has fallen in the dam catchment over the last two hours (recorded falls exceed 60mm in some areas) will result in significant inflows later today. The current release rate into Wivenhoe Dam is 35,000ML/day. Since the commencement of the event on 02/01/2011 approximately 56,000ML has been released from the dam, with a total of at least 150,000ML to be released based on the currently recorded rainfall. The total release for the event is likely to increase significantly over the next few days based on the current rainfall forecasts. At this stage, releases will continue until at least Tuesday.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

The dam level is currently falling slowly, with the current level being 68.58m AHD. River levels upstream of the dam are receding, however further inflows will result from any additional rainfall. The current gate operation strategy will maintain flows of around 1,600m³/s in the mid-Brisbane River. The current release rate from Wivenhoe Dam is 116,000ML/day. Since the commencement of the event on 02/01/2011 approximately 150,000ML has been released from the dam, with a total of at least 450,000ML to be released based on the currently recorded rainfall. The total release for the event is likely to increase over the next few days based on the current rainfall forecasts. At this stage, releases will continue until at least Wednesday.

Impacts downstream of Wivenhoe Dam

The current Wivenhoe Dam release combined with Lockyer flows and local runoff will mean that all low level crossings downstream of Wivenhoe (Twin Bridges, Savages Crossing, Burtons Bridge, Kholo Bridge and Colleges Crossing) will be adversely impacted until at least Wednesday 12 January. At this stage Fernvale and Mt Crosby Weir Bridge are not expected to be affected, but this may be revised if the predicted rainfall totals eventuate and higher releases from Wivenhoe Dam are considered necessary.

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the Wivenhoe operating strategy.

The current available assessments indicate that the combined flow in the lower Brisbane R would only add 50mm to an upper limit of 100mm to the recorded water levels in the City Reach of the Brisbane River. However, it is noted that tides in the lower Brisbane R will be 0.4 to 0.5 metres higher than predicted tides

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 10

Date: Monday 10 January 2011

Time: 06:23

The Flood Centre has kept you informed (and discussed with the BCC Flood Centre) of where we are at but below is a summary as at 1am this morning.

I will send off another Technical Report this morning so if you have any assessments or actions you are undertaking that you want included send them in.

Rainfall

Very heavy rainfall has been recorded in the Upper Brisbane and Stanley Rivers in the last 12 hours with totals up 100 to 240mm. Totals for the last 24 hours range from 100 to 300mm.

Rainfall of similar magnitudes is expected in the 12 to 24 hours around the downstream catchments as the system tracks south.

A severe weather warning remains current for heavy rainfall in the dam catchment areas.

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level was 39.95 m and steady. Five gates are open releasing 445 m³/s. The inflow into the dam since the commencement of the event is 42,000 ML. Estimated event volume is 57,000 ML assuming no further rainfall. Gate operations will continue until at least Tuesday 11 January 2011.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 102.22 m AHD and rising quickly (storing 157,000 ML above FSL). Peak inflow to the dam is estimated to be about 4,200 m³/s based on observed rainfall and could be as high as 5,000m³/s with additional forecast rainfall. Five sluice gates are open releasing about 1,100m³/s (95,000ML/d) into Wivenhoe Dam. At this stage the dam will reach at least 103.5 on Monday afternoon which will adversely impact areas around Kilcoy.

Since the commencement of the event on 02/01/2011 approximately 115,000ML has been released from the dam into Wivenhoe, with an event total of the order of 520,000ML expected. This is expected to increase due to the forecast rain in the next 24 to 48 hours. At this stage, releases will continue until at least Thursday.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

River levels upstream of the dam are rising quickly with significant inflow being generated from the intense heavy rainfall. Flows in the Brisbane River at Gregor's Ck have already reached 7,350m³/s and the river has just peaked at 23:00 on Sunday 9 January.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

The dam level is rising quickly, with the current level being 69.60m AHD (storing 301,000 ML). Estimated peak inflow to the dam just from the Upper Brisbane R alone may reach as high as 8,800m³/s and, at this stage, the dam will reach at least 73.3 m AHD during Tuesday morning. Given the rapid increase in inflow volumes, it will be necessary to increase the release from Wivenhoe during Monday morning.

The objective for dam operations will be to minimise the impact of urban flooding in areas downstream of the dam and, at this stage, releases will be kept below 3,500m³/s and the combined flows in the lower Brisbane will be limited to 4,000m³/s if possible.

Fernvale Bridge approaches and Mt Crosby Weir Bridge have been inundated and both bridges are now closed or are in the process of being closed.

The current release rate from Wivenhoe Dam is 1,400m³/s (120,000ML/day). Gate opening will start to be increased during early Monday morning and the release is expected to increase to at least 2,600m³/s.

Since the commencement of the event on 02/01/2011 approximately 240,000ML has been released from the dam, with an event total approaching 1,500,000ML without further rain and as much as 2,100,000ML with forecast rainfall of (both including Somerset outflow). At this stage, releases will continue until at least Sunday 16th January 2011.

Impacts downstream of Wivenhoe Dam

The projected Wivenhoe Dam releases combined with Lockyer flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Saturday 15 January in varying degrees.

Water levels in the lower Brisbane R will be impacted by the combined flows of Lockyer Ck, Bremer River, local runoff and releases from Wivenhoe Dam. Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the Wivenhoe operating strategy.

Dam Operations Manager
Water Delivery
Queensland Bulk Water Supply Authority *trading as Seqwater*

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 11

Date: Monday 10 January 2011

Time: 15:27

The Flood Centre will keep you informed or leave messages on your phones. Give them a call if you need further information.

Below is the current strategy.
Any comments or assessments let me know.

Rainfall

Significant rainfall has fallen in the Wivenhoe Dam catchment over the last 3 hours, with falls exceeding 100mm. This rainfall will significantly increase inflows into the dam. A severe weather warning remains current for heavy rainfall in the dam catchment areas. The QPF issued by BOM at 10:00 estimates rainfalls for the 24 hours to 10:00 Tuesday as North Pine Dam (75mm to 150mm); Wivenhoe/Somerset Dam Catchments (50mm – 100mm). Potentially significant rain moving towards the dam catchments is currently evident on the BOM radar.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 103.41m AHD and rising. Peak inflow to the dam is estimated to be about 4,200 m³/s. Five sluice gates are open releasing about 1,100m³/s (95,000ML/day) into Wivenhoe Dam. At this stage the dam lake level will reach about 103.5m AHD on Monday afternoon. Areas around Kilcoy will continue to be adversely affected.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

The dam level is 72.41m AHD and rising quickly. The rainfall experienced over the last 2 to 3 hours will result in significant further inflows into the dam and releases from the dam will need to be increased in accordance with Flood Mitigation procedures and to ensure that a fuse plug is not initiated. The initiation of a fuse plug will result in a rapid uncontrolled outflow from the dam of 2,000m³/s being added to the gate release outflow. Outflows into the Brisbane River from both Lockyer Creek and the Bremer River are also increasing.

Five radial gates are currently open at the dam releasing about 2,000m³/s into the Brisbane River and this will need to be increased steadily to an outflow of 2,800m³/s over the next 9 hours (commencing at 1500). At this stage, the dam will reach about 73.8m AHD during Tuesday morning.

The objective for dam operations is currently to minimise the impact of urban flooding in areas downstream of the dam and to keep river flows in the lower Brisbane River below 4,000m³/s if possible. This is significantly less than the current estimated combined pre-dam peak inflow of 12,000m³/s. If further rainfall occurs, dam releases may need to be increased further and this may result in river flows in the lower Brisbane River approaching or exceeding 5,000m³/s.

Impacts downstream of Wivenhoe Dam

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

The projected Wivenhoe Dam releases combined with Lockyer Creek flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Sunday 16 January in varying degrees.

Water levels in the lower Brisbane River will be impacted by the combined flows of Lockyer Creek, Bremer River, local runoff and releases from Wivenhoe Dam.

Outlook

Heavy rainfall continues throughout South East Queensland and the situation could deteriorate rapidly over the next 24 hours. The flood operation centre will continue to monitor the situation and provide every six hours until the situation stabilizes.

Dam Operations Manager
Water Delivery
Queensland Bulk Water Supply Authority *trading as Seqwater*

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 12

Date: Tuesday 11 January 2011

Time: 06:38

The Flood Centre has kept you informed (and discussed with the BCC Flood Centre) of where we are at but below is a summary as at 6am this morning.

I will send off another Technical Report this morning so if you have any assessments or actions you are undertaking that you want included send them in.

Rainfall

Rainfall continues in the North Pine Dam, Somerset Dam and Wivenhoe Dam catchments. Isolated falls in the Upper Brisbane River of up to 125 mm have been recorded with widespread falls of 40 to 70 mm in the Somerset Dam catchment. This rainfall will increase inflows into the dam.

There has also been 20 to 60 mm in the Lockyer Creek catchment in the last 12 hours with falls of up to 30 mm in the Bremer River.

A severe weather warning remains current for heavy rainfall in the dam catchment areas. The QPF issued by BOM at 16:00 estimates rainfalls for the 24 hours to 10:00 Tuesday as North Pine Dam (25mm to 50mm, with isolated falls to 100mm); Wivenhoe/Somerset Dam Catchments (25mm to 50mm, with isolated falls to 100mm).

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level is 39.80m AHD and has commenced rising again (storing 4,400ML above FSL). Five gates are open releasing 177 m³/s. The inflow into the dam since the commencement of the event is 77,000 ML. Estimated event volume is 88,000 ML assuming no further rainfall. Releases from the dam will continue until at least Wednesday 12 January 2011.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 103.27m AHD and falling slowly. Peak inflow to the dam is estimated to be about 4,200 m³/s. Total discharge into Wivenhoe Dam is currently 1400 m³/s and this discharge will be decreased in the next few hours to be around 500 m³/s later on Tuesday. This is to ensure that the combined flood mitigation capacity in Somerset and Wivenhoe Dam is maximized.

The dam level peaked at 103.52m AHD at 19:00 on Monday 10 January 2011, (unless further significant rainfall is experienced). Areas around Kilcoy will continue to be adversely affected.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

The dam level is 73.51m AHD and rising at about 25 mm/hour. Releases from the dam have been held at a rate of 2,750 m³/s since 19:30 hours on Monday 10 January

APPENDIX F – COMMUNICATION PROTOCOL

TECHNICAL SITUATION REPORTS

2011. Outflows into the Brisbane River from both Lockyer Creek and the Bremer River are also increasing.

The BoM has provided further advice about the flash flooding experienced in the upper areas of Lockyer Creek. The rainfall responsible for this event was not observed at any rainfall stations but it is considered to be extreme. Flood levels in the Lockyer Creek catchment will exceed maximum recorded levels in some stations in the upper catchment. This flow will result in increases in Brisbane River levels below the junction of Lockyer Creek.

Five radial gates are currently open at the dam releasing about 2,750m³/s into the Brisbane River. At this stage, the dam will reach just over 74.0m AHD during Tuesday evening.

Above EL 74.0m AHD the objective for dam operations is to maintain the security of the dam and minimise downstream flood flows if possible.

If further rainfall occurs, dam releases may need to be increased further and this may result in river flows in the lower Brisbane River approaching or exceeding 5,000m³/s.

Impacts downstream of Wivenhoe Dam

The projected Wivenhoe Dam releases combined with Lockyer Creek flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Sunday 16 January in varying degrees.

Water levels in the lower Brisbane River will be impacted by the combined flows of Lockyer Creek, Bremer River, local runoff and releases from Wivenhoe Dam.

The BoM will provide further information regarding the magnitude of the flash flood event occurring in Lockyer Creek early Tuesday morning. Consideration was given to modifying the releases from Wivenhoe Dam to try to moderate the peak flows emanating from Lockyer Creek but the rainfall in the past 12 hours in the catchment above the dam makes this option not possible. Therefore instead of decreasing releases to accommodate the Lockyer Creek flows, the strategy will endeavour to maintain the current releases until Lockyer Creek peaks.

Outlook

Heavy rainfall continues throughout South East Queensland and the situation could deteriorate over the next 24 hours. The flood operation centre will continue to monitor the situation and provide situation reports every six hours until the situation stabilizes.

Dam Operations Manager
Water Delivery
Queensland Bulk Water Supply Authority *trading as Seqwater*

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 13

Date: Wednesday 12 January 2011

Time: 11:30

I haven't been sending many of these as the Flood Centre has been forwarding all their sit reps to you directly which are the same.

However will keep sending these in case there are other issues that may come up or issues you want to raise.

Rainfall

No significant rain has fallen over the catchments in the past twelve hours. Less than 10 to 15 millimeters of rainfall is expected over the next 24-48 hours.

Somerset/Wivenhoe

Somerset Dam has peaked at 105.11 m AHD at 08:00 on 12 January 2011 and the dam is discharging over the spillway.

One Sluice gate has been opened around 11am to assist the draining of the flood storage compartment. Further sluices may be opened during the day to relieve upstream impacts. At 11am Somerset was 105.06m and 716,900ML at 188.7% and dropping slightly.

Wivenhoe Dam peaked at 74.97 m AHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s.

At 11am Wivenhoe Dam was 74.78 m AHD at 2,197,000ML and 188.5% and generally steady.

The releases from Wivenhoe Dam have been temporarily reduced to 2,500 m³/s at 07:30 to allow the peak of Lockyer Creek to enter the Brisbane River. After the downstream peak in the lower Brisbane River has passed, releases will be increased to maximum of 3,500 m³/s. This release will then be maintained to drain the flood storage component within the required 7 days.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be around 2.3 million megalitres.

North Pine

At 11:00 North Pine Dam was 39.77 m AHD and falling and still releasing from 5 gates. North Pine has peaked at 41.11 m AHD at 14:00 on 11 January 1974 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML. It is expected that gates will now not close until Thursday or Friday.

Dam Operations Manager
Water Delivery
Queensland Bulk Water Supply Authority *trading as Seqwater*

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 14

Date: Thursday 13 January 2011

Time: 12:46

Attached is an update as at 12pm.

Again let me know of any issues.

Will send one each day.

Rainfall

Rainfall in the last 12 hours is generally below 5mm with isolated falls of up to 15mm in the Stanley, Lockyer and Pine River catchments. There is no significant rain expected for the next 4 days.

Somerset/Wivenhoe

Somerset Dam has peaked at 105.11 mAHD at 06:00 on 12 January 2011. Three sluices are opened as at 1300 12 January 2011 and discharging 1,250 m³/s into Wivenhoe Dam. Sluice gates will be utilised to drain of the flood storage compartment during the next 5 days. Water levels in Somerset Dam will fall slowly in the next 24 hours.

At 12pm Somerset was 103.96m and 642,535ML at 169.2%.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s.

The releases from Wivenhoe Dam had been temporarily reduced to 2,500 m³/s at 07:30 on Wednesday 12 January 2011 to allow the peak of Lockyer Creek to enter the Brisbane River. The Brisbane River has peaked at the Port Office Gauge early Thursday morning. Releases from Wivenhoe Dam will now be managed gradually from 1pm Thursday 13.1.2011 to achieve a target flow of around 3,500 m³/s at Moggill. This release will then be managed to drain the flood storage component within the required 7 days. This will not cause renewed rises downstream.

At 12pm Wivenhoe Dam was 74.61 m AHD at 2,170,100ML and 186.2% and dropping slowly.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

North Pine

At 12pm North Pine Dam still gates open. North Pine peaked at 41.11 mAHD at 14:00 on 11 January 2011 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

At 12pm North Pine Dam was 39.64m AHD and 215,179ML and 100.4% and slowly falling. It is expected that gates will be closed early Friday morning.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels through the Brisbane and Pine catchments and reviewing operating strategy every 30 minutes. The FOC is maintaining close contact with warning agencies and local councils.

Leslie Harrison Dam:

Gates closed.

Hinze Dam:

A release of around 8,000 megalitres a day is being made through the emergency gates. The Lake Level is dropping. There is no public access to the spillway.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 15

Date: Friday 14 January 2011

Time: 05:38

Update as of this morning.

As usual, let us know if there are any issues or concerns.

And feel free to contact the Flood Centre for details or discuss.

Rainfall

There has been no significant rainfall in the last 12 hours and none is expected for the next 5 days.

Somerset/Wivenhoe

Somerset Dam has peaked at 105.11 mAHD at 06:00 on 12 January 2011. Four sluices are opened. Sluice gates will be utilised to drain of the flood storage compartment during the next 4 days. Water levels in Somerset Dam will fall slowly in the next 24 hours.

At 5am Somerset was 102.87m and 574,852ML at 151.3% and discharging 1,277cumecs.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s.

The releases from Wivenhoe Dam are being managed to achieve a target flow of around 3,500 m³/s at Moggill. This release will then be maintained to drain the flood storage component within the required 7 days.

At 5am Wivenhoe Dam was 74.08 m AHD at 2,087,960ML and 179.22% and dropping slowly and discharging around 3,500cumecs and this flow will be maintained until early next week.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

North Pine

North Pine peaked at 41.11 mAHD at 14:00 on 11 January 2011 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML

At 5am North Pine Dam was 39.4mAHD and 210,040ML and 98.0% and all gates were closed.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels through the Brisbane and Pine catchments and reviewing operating strategy every 30 minutes. The FOC is maintaining close contact with warning agencies and local councils.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 16

Date: Saturday 15 January 2011

Time: 07:08

Attached is an update as at 6am today.

Again let me know of any issues.

The FOC and the BCC have kept up discussions re any impacts of release strategy. If there are any concerns re effects on houses or recovery that arrive get back to the FOC any time.

Will send one each day.

Aiming to have most of flood storage drained by Wednesday but will have better idea of closing times over next few days. Then may have better idea as to when bridges will come out. But again contact the FOC if you want.

Rainfall

There has been no significant rainfall in the last 24 hours and no significant rainfall is expected in the next twenty-four hours. Mostly fine conditions are expected over the weekend, but showers will return early next week.

Somerset/Wivenhoe

Somerset Dam has peaked at 105.11 mAHD at 06:00 on 12 January 2011. Four sluices are opened. Sluice gates will be utilised to drain of the flood storage compartment during the next 4 days. Water levels in Somerset Dam will fall slowly in the next 24 hours.

At 6am Somerset was 101.35m and 490,137ML at 129.0% and discharging 920cumecs.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s.

The releases from Wivenhoe Dam are being managed to achieve a target flow of around 3,500 m³/s at Moggill. This release will then be maintained to drain the flood storage component by around Wednesday 19th January.

At 5am Wivenhoe Dam was 72.86 m AHD at 1,905,900ML and 163.6% and dropping slowly and discharging around 3,500cumecs and this flow will be maintained.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

North Pine

North Pine peaked at 41.11 mAHD at 14:00 on 11 January 2011 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

At closure North Pine Dam was 39.4mAHD and 210,040ML and 98.0% and all gates were closed. The current level is expected to increase to just over 39.5 mAHD in the next few days due to base-flow. This could be higher if further rainfall occurs.

MBRC will inspect Youngs Crossing to determine if the crossing can be re-opened

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels throughout the Brisbane and Pine River catchments and is maintaining close contact with warning agencies and local councils.

Leslie Harrison Dam:

Gates closed.

Hinze Dam:

A release of around 6,800megalitres a day is being made through the emergency gates. The Lake Level is dropping and the gate should be closed around Tuesday next week. There is no public access to the spillway.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 18

Date: Monday 17 January 2011

Time: 09:46

The FOC is planning to initiate a closing sequence some time this afternoon if levels of the dam are tracking properly.

With final closure Wednesday, probably in the morning at this stage.

They will give you a call later today once they have a better idea of timing.

Rainfall

There has been no significant rainfall in the last 24 hours and no significant rainfall is expected in the next twenty-four hours.

Somerset/Wivenhoe

Somerset Dam peaked at 105.11 mAHD at 06:00 on 12 January 2011.

At 6am Somerset was 99.07m and 382,829ML at 100.8% and discharging through cone valves. All sluices are shut.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s.

The releases from Wivenhoe Dam are being managed to achieve a target flow of around 3,500 m³/s at Moggill. This release will then be maintained to drain the flood storage component by around Wednesday 19th January with a closing sequence to start today some time.

At 6am Wivenhoe Dam was 69.4 m AHD at 1,441,983ML and 123.8% and dropping and discharging around 3,477cumecs and this flow will be maintained until the closing sequence begins. Aim is for final closure on Wednesday.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

North Pine

North Pine peaked at 41.11 mAHD at 14:00 on 11 January 2011 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML

At 6am North Pine Dam was 39.54mAHD and 213,024ML and 99.4% and all gates were closed. The current level is expected to increase to stay around this level. This could be higher if further rainfall occurs.

Strategy

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 19

Date: Monday 17 January 2011

Time: 16:37

The FOC initiated closing of the gates at Wivenhoe at 2pm this afternoon.

They will have advised you of this.

Any issues let us know.

Give them a call to discuss the closing sequence if you want.

Rainfall

There has been no significant rainfall in the last 24 hours and no significant rainfall is expected in the next twenty-four hours.

Somerset/Wivenhoe

Somerset Dam peaked at 105.11 mAHD at 06:00 on 12 January 2011.

At 4pm Somerset was 99.02m and 380,700ML at 100.2% and discharging through cone valves. All sluices are shut.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s.

At 4pm Wivenhoe Dam was 68.66 m AHD at 1,352,706ML and 116.1% and dropping. The closing sequence started at 2pm today and releases will be slowly decreased through gate closures over the next few days to reach FSL around Thursday morning.

Discussions with BCC indicated they would prefer a Thursday closure to increase release time and minimize possible impacts re slumping along Coronation Drive. They also would like closure no later than Thursday prior to predicted high tides late this week.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

North Pine

North Pine peaked at 41.11 mAHD at 14:00 on 11 January 2011 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML

At 4pm North Pine Dam was 39.54mAHD and 213,024ML and 99.4% and all gates were closed. The current level is expected to increase to stay around this level. This could be higher if further rainfall occurs.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 20

Date: Tuesday 18 January 2011

Time: 06:51

The FOC initiated closing of the gates at Wivenhoe at 2pm this afternoon aiming at final closure Thursday morning.

Any issues let us know.

Give them a call to discuss the closing sequence if you want.

Rainfall

There has been no significant rainfall in the last 24 hours and no significant rainfall is expected in the next twenty-four hours. Mostly fine conditions are expected over the weekend, but showers will return early next week.

Somerset/Wivenhoe

Somerset Dam peaked at 105.11 mAHD at 06:00 on 12 January 2011.

At 6am Somerset was 98.98m and 379,016ML at 99.8% and discharging through one cone valve. All sluices are shut.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s.

At 6am Wivenhoe Dam was 67.82 m AHD at 1,255,638ML and 107.8% and dropping.

Releases were held constant overnight at about 2,050 m³/s to assist water supply pumping at Lowood. Following discussions with water supply operators, it has been decided to resume closing gates at 09:00 Tuesday before final closure on Thursday morning. The Dam will be near full supply and releases will be made through the regulator to account for ongoing base-flow.

Discussions with BCC indicated they would prefer a Thursday closure to increase release time and minimize possible impacts re slumping along Coronation Drive. They also would like closure no later than Thursday prior to predicted high tides late this week.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

It should be noted that the Seqwater water level gauge currently being reported on the BoM website is currently slightly under reading by about 50mm.

APPENDIX G – SEVERE WEATHER WARNINGS

THUNDERSTORM WARNINGS

Thunderstorm Warning 1

Date: Wednesday 5 January 2011

Time: 16:22

From: Aifs Operational Manager
Sent: Wednesday, January 05, 2011 4:22:08 PM
To: weather
Subject: BOM: Severe Thunderstorm Warning - SE Qld 1 [SEC=UNCLASSIFIED] Auto forwarded by a Rule

IDQ20038
Bureau of Meteorology
Queensland Regional Office

TOP PRIORITY FOR IMMEDIATE BROADCAST

SEVERE THUNDERSTORM WARNING - SOUTHEAST QUEENSLAND for DAMAGING WIND, FLASH FLOODING and LARGE HAILSTONES For people in parts of the BRISBANE CITY, LOCKYER VALLEY, MORETON BAY and SOMERSET Council Areas.

Issued at 4:19 pm Wednesday, 5 January 2011.

The Bureau of Meteorology warns that, at 4:20 pm, severe thunderstorms were detected on weather radar near Esk and northern Lake Wivenhoe.

They are forecast to affect the area south of Esk by 4:50 pm and southern Lake Wivenhoe by 5:20 pm.

Damaging winds, very heavy rainfall, flash flooding and large hailstones are likely.

Emergency Management Queensland advises that people should:

- * Move your car under cover or away from trees.
- * Secure loose outdoor items.
- * Avoid driving, walking or riding through flood waters.
- * Seek shelter, preferably indoors and never under trees.
- * Avoid using the telephone during a thunderstorm.
- * Beware of fallen trees and powerlines.
- * For emergency assistance contact the SES on 132 500.

The next warning is due to be issued by 5:20 pm.

Warnings are also available through TV and Radio broadcasts, the Bureau's website at www.bom.gov.au or call 1300 659 219. The Bureau and Emergency Management Queensland would appreciate warnings being broadcast regularly.

TOP PRIORITY FOR IMMEDIATE BROADCAST

SEVERE THUNDERSTORM WARNING
for **DAMAGING WIND** and **FLASH FLOODING**
For people in the Wide Bay and Burnett, Southeast Coast and parts of the Central Highlands and Coalfields, Maranoa and Warrego and Darling Downs and Granite Belt Forecast Districts.

Issued at 7:13 pm Wednesday, 19 January 2011.

Severe thunderstorms are likely to produce damaging winds, very heavy rainfall and flash flooding in the warning area over the next several hours. Locations which may be affected include Warwick, Gold Coast, Toowoomba, Brisbane, Maroochydore, Gympie, Bundaberg, Kingaroy and Roma.

Rainfall rates of 52mm in 30 minutes has been observed at Romani, SSE of Ipswich.

Emergency Management Queensland advises that people should:

- * Move your car under cover or away from trees.
- * Secure loose outdoor items.
- * Avoid driving, walking or riding through flood waters.
- * Seek shelter, preferably indoors and never under trees.
- * Avoid using the telephone during a thunderstorm.
- * Beware of fallen trees and powerlines.
- * For emergency assistance contact the SES on 132 500.

The next warning is due to be issued by 10:15 pm.

If severe thunderstorms develop in the Southeast Queensland area [east of Dalby from Rainbow Beach to Stanthorpe], a more detailed Severe Thunderstorm Warning will be issued to people in this area.

Warnings are also available through TV and Radio broadcasts, the Bureau's website at www.bom.gov.au or call 1300 659 219. The Bureau and Emergency Management Queensland would appreciate warnings being broadcast regularly.

TOP PRIORITY FOR IMMEDIATE BROADCAST SEVERE WEATHER WARNING

for heavy rainfall leading to localised flash flooding and potentially worsening the existing river flood situation For people in the Darling Downs and Granite Belt, Southeast Coast, Wide Bay and Burnett, Capricornia and Central Highlands and Coalfields district.

Issued at 5:00 pm on Wednesday 5 January 2011

Synoptic Situation: At 4pm EST, a trough extended from northwestern Queensland into the Darling Downs. The trough is expected to intensify as it moves slowly east over the next 24 hours.

Thundery rain areas with some heavy falls are occurring over the Darling Downs and Granite Belt, Southeast Coast districts and southern parts of the Wide Bay and Burnett and Central Highlands and Coalfields districts. This heavy rain is expected to extend to the Capricornia and remaining parts of the Wide Bay and Burnett and eastern Central Highlands and Coalfields during Thursday. The rain will ease over the western Darling Downs and southwestern Central Highlands and Coalfields on Thursday.

Heavy rainfall may lead to localised flash flooding and/or worsen current river flooding.

Heavy rainfall has eased over the Maranoa District and a Severe Weather Warning for this area is no longer current.

Flood warnings are current for various rivers and streams in these districts; refer to these products [www.bom.gov.au/qld] for further information.

The State Emergency Service advises that people in the affected area should:
avoid driving, walking or riding through flood waters take care on the roads, especially in heavy downpours avoid swimming in swollen rivers and creeks

Contact the SES on 132 500 for emergency assistance if required.

The next warning is due to be issued by 11:00 pm Wednesday

IDQ20032
Australian Government Bureau of Meteorology Queensland

TOP PRIORITY FOR IMMEDIATE BROADCAST SEVERE WEATHER WARNING

for heavy rainfall leading to localised flash flooding and potentially worsening the existing river flood situation For people in the Southeast Coast and eastern parts of the Wide Bay and Burnett districts.

Issued at 5:25 am on Friday 7 January 2011

Synoptic Situation: At 0420am EST, an upper level low occurs over the Capricorn region at present and will contribute to further rain areas over southeastern region today.

Some heavy falls may occur about the eastern Burnett, Wide Bay and northern parts of the Sunshine coast later today with the potential for flash flooding and this may contribute to existing flooding situation.

Flood warnings are current for various rivers and streams in these districts; refer to these products [www.bom.gov.au/qld] for further information.

The State Emergency Service advises that people in the affected area should:
avoid driving, walking or riding through flood waters take care on the roads, especially in heavy downpours avoid swimming in swollen rivers and creeks

Contact the SES on 132 500 for emergency assistance if required.

The next warning is due to be issued by 11am Thursday

This warning is also available through TV and Radio broadcasts; the Bureau's website at www.bom.gov.au or call 1300 659 219. The Bureau and State Emergency Service would appreciate this warning being broadcast regularly.

TOP PRIORITY FOR IMMEDIATE BROADCAST SEVERE WEATHER WARNING

for heavy rainfall leading to localised flash flooding and potentially worsening the existing river flood situation For people in the Southeast Coast and Wide Bay and Burnett forecast districts.

Issued at 8:25 am on Friday 7 January 2011

Synoptic Situation: At 7am EST, an upper level low was located over the Capricornia district while a low level trough was located off the Capricorn coast. These systems will combine to produce further rain areas and thunderstorms over the Southeast Coast and Wide Bay and Burnett forecast districts.

Some heavy falls are currently occurring about southern parts of the Southeast Coast District. Heavy rainfall is also expected to develop further north about the Sunshine Coast and Wide Bay and Burnett district through today. Rainfalls should ease south of the Sunshine Coast later today.

Heavy rainfalls may lead to localised flash flooding and/or worsen existing river flooding.

Flood warnings are current for various rivers and streams in these districts; refer to these products [www.bom.gov.au/qld] for further information.

The State Emergency Service advises that people in the affected area should:
avoid driving, walking or riding through flood waters take care on the roads, especially in heavy downpours avoid swimming in swollen rivers and creeks

Contact the SES on 132 500 for emergency assistance if required.

The next warning is due to be issued by 11am Thursday

This warning is also available through TV and Radio broadcasts; the Bureau's website at www.bom.gov.au or call 1300 659 219. The Bureau and State Emergency Service would appreciate this warning being broadcast regularly.

Heavy falls may lead to localised flash flooding and/or worsen existing river flooding.

The heavy rain areas and thunderstorms are expected to contract southwards into the Southeast Coast district and southeast parts of the Darling Downs and Granite Belt district during Tuesday.

Recent events: In the 24 hours to 9am EST Monday morning, Maleny received 321mm, West Bellthorpe 310 mm and Peachester 298 mm.

Flood warnings are current for various rivers and streams in these districts; refer to these products [www.bom.gov.au/qld] for further information.

The State Emergency Service advises that people in the affected area should:
avoid driving, walking or riding through flood waters take care on the roads, especially in heavy downpours avoid swimming in swollen rivers and creeks

Contact the SES on 132 500 for emergency assistance if required.

The next warning is due to be issued by 5 pm Monday.

APPENDIX G – SEVERE WEATHER WARNINGS

This warning is also available through TV and Radio broadcasts; the Bureau's website at www.bom.gov.au or call 1300 659 219. The Bureau and State Emergency Service would appreciate this warning being broadcast regularly.

APPENDIX G – SEVERE WEATHER WARNINGS

Weather Warning 26

Date: Monday 10 January 2011

Time: 17:06

From: Aifs Operational Manager
Sent: Monday, January 10, 2011 5:06:14 PM
To: weather

IDQ20032
Australian Government Bureau of Meteorology Queensland

TOP PRIORITY FOR IMMEDIATE BROADCAST SEVERE WEATHER WARNING

for heavy rainfall leading to localised flash flooding and potentially worsening the existing river flood situation For people in the Southeast Coast district, far southern parts of the Wide Bay and Burnett district and eastern parts of the Darling Downs and Granite Belt district.

Issued at 5:05 pm on Monday 10 January 2011

Synoptic Situation: At 4pm EST, an upper level low was located over the west of the Wide Bay and Burnett district. A surface trough was located off the east Queensland coast. The upper low is forecast to move southwest over the southern interior of Queensland while the surface trough remains slow moving.

Heavy rain areas and thunderstorms are expected to continue through the Southeast Coast district and eastern parts of the Darling Downs and Granite Belt district. Heavy falls may lead to localised flash flooding and/or worsen existing river flooding.

The heavy rain areas and thunderstorms are expected to contract southwards and gradually ease in the Southeast Coast district and eastern parts of the Darling Downs and Granite Belt district later on Tuesday.

Rainfall has eased in far southern parts of the Wide Bay and Burnett district and therefore the warning for this district is now CANCELLED.

Recent events: In the 24 hours to 9am EST Monday, Maleny received 321mm, West Bellthorpe 310 mm and Peachester 298 mm.
In the 7 hours since 9am EST Monday, Redbank Creek received 126mm, Toowoomba Airport 88mm and Mt Castle 80mm.

Flood warnings are current for various rivers and streams in these districts; refer to these products [www.bom.gov.au/qld] for further information.

The State Emergency Service advises that people in the affected area should:
avoid driving, walking or riding through flood waters take care on the roads, especially in heavy downpours avoid swimming in swollen rivers and creeks

APPENDIX G – SEVERE WEATHER WARNINGS

Contact the SES on 132 500 for emergency assistance if required.

The next warning is due to be issued by 11pm Monday.

This warning is also available through TV and Radio broadcasts; the Bureau's website at www.bom.gov.au or call 1300 659 219. The Bureau and State Emergency Service would appreciate this warning being broadcast regularly.

TOP PRIORITY FOR IMMEDIATE BROADCAST SEVERE WEATHER WARNING

for heavy rainfall leading to localised flash flooding and potentially worsening the existing river flood situation For people in the Southeast Coast, Darling Downs and Granite Belt and eastern parts of the Maranoa and Warrego districts.

Issued at 6:30 pm on Monday 10 January 2011

Synoptic Situation: At 6pm EST, an upper level low was located over the west of the Wide Bay and Burnett district. A surface trough was located off the east Queensland coast. The upper low is forecast to move southwest over the southern interior of Queensland while the surface trough remains slow moving.

Heavy rain areas and thunderstorms are expected to continue through the Southeast Coast, Darling Downs and Granite Belt and eastern parts of the Maranoa and Warrego districts this evening. Heavy falls may lead to localised flash flooding and/or worsen existing river flooding.

The heavy rain areas and thunderstorms are expected to contract into the Southeast Coast and eastern parts of the Darling Downs and Granite Belt districts during Tuesday. These conditions should gradually ease later in the day.

Recent events: In the 24 hours to 9am EST Monday, Maleny received 321mm, West Bellthorpe 310 mm and Peachester 298 mm.
In the 7 hours since 9am EST Monday, Redbank Creek received 126mm, Toowoomba Airport 88mm and Mt Castle 80mm.

Transmitters in the areas of the Southeast Coast District and the Darling Downs and Granite Belt District southeast of Dalby to Goondiwindi are REQUESTED TO USE THE STANDARD EMERGENCY WARNING SIGNAL BEFORE BROADCASTING.

TOP PRIORITY FOR IMMEDIATE BROADCAST

SEVERE WEATHER WARNING

for heavy rainfall leading to localised flash flooding and worsening the existing river flood situation For people in the Southeast Coast District and the Darling Downs and Granite Belt District southeast of Dalby to Goondiwindi.

Issued at 8:00 am on Tuesday 11 January 2011

Synoptic Situation: At 8am AEST, an upper level low was located over the Darling Downs and Granite Belt district and is forecast to move to the southwest and slowly weaken.

Heavy rain areas and thunderstorms are expected to continue through the Southeast Coast and Darling Downs and Granite Belt today. Heavy falls will lead to localised flash flooding and will worsen existing river flooding.

Currently, an intense slow moving band of rainfall extends from about Maroochydore to Warwick. Rainfall rates in this band are reaching 80 to 100 mm per hour.

Flood warnings are current for various rivers and streams in these districts. Please refer to these products [www.bom.gov.au/qld] for further information.

The Severe Weather Warning for the southern parts of Wide Bay and Burnett and eastern Maranoa and Warrego and northwestern parts of Darling Downs and Granite Belt districts has been cancelled. However showers and thunderstorms will persist through the area and may produce heavy rainfall in these parts.

The State Emergency Service advises that people in the affected area should:
avoid driving, walking or riding through flood waters take care on the roads, especially in heavy downpours avoid swimming in swollen rivers and creeks

Contact the SES on 132 500 for emergency assistance if required.

The next warning is due to be issued by 11am Tuesday.

for heavy rainfall leading to flash flooding and worsening the existing river flood situation
For people in the Southeast Coast District and the Darling Downs and Granite Belt District southeast of Dalby to Goondiwindi.

Issued at 11:00 am on Tuesday 11 January 2011

Synoptic Situation: At 10am AEST, an upper level low was located over the southern Queensland interior and is forecast to move to the southwest and continue weakening. A surface trough lying over the Southeast Queensland Coast is expected to weaken overnight.

Heavy rain areas and local thunderstorms are expected to continue through the Southeast Coast and Darling Downs and Granite Belt today. Heavy falls will lead to flash flooding and will worsen existing river flooding.

Currently, an intense band of rainfall extends from about Tewantin to Warwick. Recent rainfall rates in this band have reached 80 to 100 mm per hour, particularly about the Brisbane and Lockyer Valleys. This rainfall band is expected to remain slow moving during the remainder of today.

Flood warnings are current for various rivers and streams in these districts. Please refer to these products [www.bom.gov.au/qld] for further information.

The State Emergency Service advises that people in the affected area should:
avoid driving, walking or riding through flood waters take care on the roads, especially in heavy downpours avoid swimming in swollen rivers and creeks

APPENDIX J – FORECAST RAINFALL COMPARISON

Seqwater commenced development of a new flood modelling system, FEWS, in March 2010. A prototype was delivered in early November 2010 at which time forecast rainfall from the Bureau's ACCESS Numerical Weather Prediction models was ingested into the system several times per day. These models cover different coverage at varying resolutions and are generated at different times of the day. The results of the models are merged, downscaled to the Brisbane area and gridded to produce forecast the images below. The grid of the actual rainfall is based upon all available ALERT stations in the Enviromon data collection system and is generated by FEWS using surface fitting techniques.

Model	Domain	Resolution (km)	Duration (hours)	Runs (UTC)
ACCESS-G	Global	~80	+240	00,12
ACCESS-R	Regional	~37.5	+72	00,12
ACCESS-T	Tropical	~37.5	+72	00,12
ACCESS-A	Australia	~12	+48	00,06,12,18
ACCESS-BR	Brisbane	~5	+36	00,12

A full description of the ACCESS Numerical Weather Prediction models can be found on BoM's web site.

While FEWS outputs were not available during the Event, the forecast rainfalls used (QPF, Silo and Interactive Weather and Wave Maps) are based upon the ACCESS model outputs.

The scale shown below has been adopted in all of the maps below and indicates the rainfall depth in millimetres.

	>= 0
	>= 5
	>= 10
	>= 25

APPENDIX K – 3-DAY ASSESSMENTS AND MODEL RESULTS

Date: Sunday 9 January 2011

Time: 11:02

From: Duty Engineer

Sent: Sunday, 9 January 2011 11:02 AM

To: Distribution List

Cc: Distribution List

Subject: Forecast Rainfall and Possible Runoff

Forecast Rainfall

The forecast for the next few days is for heavy rainfall, particularly for period 10pm Sunday to 10pm Monday with totals between 200-300mm. The areas mostly heavily impacted will be the North Pine, Somerset and Leslie Harrison catchments with less rain in the upper Brisbane

<http://www.bom.gov.au/jsp/watl/rainfall/pme.jsp>

The rain contracts to the area around North Pine for the period 10pm Monday to 10pm Tuesday with totals in the order of 100 to 150mm.

The interactive model at <http://www.bom.gov.au/australia/charts/viewer/index.shtml> shows the heaviest falls during the next 48 hours are likely to be overnight Sunday/Monday and overnight Monday/Tuesday.

The QPF for the period 24 hours to 9am show totals between 40- 60mm for both North Pine and Somerset/Wivenhoe catchments. Note that this is only half the period of the above forecast durations.

Recorded Runoff

To date recorded inflows to the dams since 02/01/2011 have been

North Pine 23,000ML

Somerset 120,000ML

Wivenhoe 380,000ML (including Somerset outflow)

Presently, the conversion rate between rainfall and runoff is about 0.45 for Wivenhoe, 0.60 for North Pine and 0.75 for Somerset.

Expected Runoff

Based on the approximate runoff conversion rates and the forecast rainfall, estimated runoff volumes (ML) generated could be of the order of:

Catchment	Monday	Tuesday	Wednesday	Three Day Total
North Pine	10,000-20,000	35,000-55,000	25,000-35,000	70,000-110,000
Somerset	50,000-100,000	200,000-300,000	75,000-150,000	325,000-550,000
Wivenhoe	125,000-250,000	250,000-500,00	125,000-250,000	500,000-1,000,000

The lower limit of the inflow to Somerset and Wivenhoe will be similar to the October 2010 flood while the upper limit is similar to the February 1999 floods. However, the starting level of the dams is much higher than in these historical events.

This points to continued flood operations for Somerset and Wivenhoe until at least the weekend of 15/16 Jan and maybe a shorter time for North Pine.

APPENDIX K – 3-DAY ASSESSMENTS AND MODEL RESULTS

It should be noted that these estimates are based upon forecast rainfall which may or may not eventuate.

Engineer 2
Duty Engineer
Flood Operations Centre

1.1.65 Flood Event - Operations Directive

TO: Somerset Dam Operators	Date: 08/01/2011
	Time: 11:30
	Directive No: 3

This transmission comprises of this page and 0 other pages.

Message:

Somerset Dam is expected to peak at around mid-day at about EL 100.48 m. As we have exceeded EL 100.45 m (fixed crest level), but Wivenhoe Dam is still rising we will need to implement Strategy S2.

This strategy is aimed at maximising the benefits of the mitigation storage in both Somerset and Wivenhoe dams. Consequently we will endeavour to follow the target line as defined in the manual.

- Please open Sluice M to 100% at 12:00.

Please confirm this gate operation by fax once you have completed the opening.

1.1.68 Flood Event - Operations Directive

TO: Somerset Dam Operators	Date: 11/01/2011
	Time: 04:30
	Directive No: 6

This transmission comprises of this page and 0 other pages.

Message:

Significant rainfall has fallen in the Upper Brisbane River in the last 12 hours. This has resulted in further inflows into Wivenhoe Dam. To prevent Wivenhoe Dam exceeding the trigger level for implementation of strategy W4 (EL74.00 m AHD) we will need to store floodwater in Somerset Dam.

Therefore we need to reduce releases from Somerset Dam so as to equalise the relative volumes in flood storage.

Please undertake the following operations:-

- Please close Sluice J at 05:00
- Please close Sluice N at 06:00
- Please close Sluice K at 07:00

Please confirm this gate operation by fax once you have completed the requested operations.

Engineer 4

1.1.75 Flood Event - Operations Directive

TO: Somerset Dam Operators	Date: 16/01/2011
	Directive No: 13
	Time: 21:30

This transmission comprises of this page and 0 other pages.

Message:

Please undertake the following operations:-

- Fully Close Sluice K at 22:00 on 16/01/2011
- Fully Close Sluice M at 03:00 on 17/01/2011
- Fully Close Sluice L at 07:00 on 17/01/2011
- Fully Open Regulator 12 at 07:15 on 17/01/2011

Please confirm this gate operation by fax once you have completed the requested operations.

Regards

Engineer 4
Duty Engineer
Appendix L

APPENDIX M – FLOOD EVENT LOG

Note: The names of individuals have been removed from this version of the Flood Event log.

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHECKED OR VERIFIED INFORMATION

APPENDIX M – FLOOD EVENT LOG

Date	Time	Action	Category	Title
Friday 7 January 2011	8:00 AM	SDWD Model Updated - SDWD-201101060800.xls	Model Run	Flood Officer 9
	8:00 AM	NPD model updated - NPD-201101060800.xls	Model Run	Flood Officer 9
	8:30 AM	Flood Officer 7 spoke with Dam Operator 9 (Stand-in Central Coordinator) about readiness of staff for flood operations. Graham confirms that staff have been rostered and are ready.	Correspondence	Flood Officer 7
	8:50 AM	Moreton Bay Regional Council (MBRC) called to query about flows at Fernvale bridge. Engineer 2 provided an update for possible gate operations.	Correspondence	Flood Officer 7
	9:05 AM	NPD Operator called to inform that North Pine Dam staff have been rostered and are ready.	Correspondence	Flood Officer 7
	9:40 AM	Dam Operations Manager called to inform that Ipswich City Council (ICC) has returned to the office and is contactable. He also requested for a situation update.	Correspondence	Flood Officer 7
	11:00 AM	ICC called for a situation update. Engineer 2 shared the release strategy for tonight.	Correspondence	Flood Officer 7
	11:49 AM	Engineer 2 advised MBRC Call Centre that North Pine Dam will commence gate operations tonight. He requested for MBRC to call him.	Correspondence	Flood Officer 7
	12:00 PM	SDWD Model Updated - SDWD-201101061200.xls	Model Run	Flood Officer 9
	12:04 PM	MBRC called. Engineer 2 advised her that the latest North Pine Dam gates may be opened will be 7:00pm today. FOC will advise them accordingly.	Correspondence	Flood Officer 7
	12:43 PM	MBRC called. Engineer 2 advised that water will be over Savages Crossing until end of the week.	Correspondence	Flood Officer 7
	12:46 PM	Engineer 2 advised Brisbane City Council (BCC) Wivenhoe Dam will commence gate operations later today.	Correspondence	Flood Officer 7
	1:32 PM	Engineer 2 left message for Somerset Regional Council (SRC) to return his call.	Correspondence	Flood Officer 7
	1:35 PM	Engineer 2 advised MBRC Wivenhoe gate operations will be delayed to Saturday morning. This is due to higher than expected inflows from Lockyer.	Correspondence	Flood Officer 7
	1:45 PM	Engineer 2 advised ICC Wivenhoe's gate operations will be delayed till Saturday morning. This is due to higher than expected inflows from Lockyer.	Correspondence	Flood Officer 7
	1:46 PM	Engineer 2 left message for BCC to return his call.	Correspondence	Flood Officer 7
	1:47 PM	Engineer 2 left message for BCC to return his call.	Correspondence	Flood Officer 7
	2:41 PM	MBRC asked for Engineer 2 mobile. He wanted to share MBRC's text message informing people living downstream from North Pine Dam.	Correspondence	Flood Officer 7
	2:45 PM	BCC called for situation update. Engineer 2 provided an update.	Correspondence	Flood Officer 7
	3:00 PM	SDWD Model Updated - SDWD-201101061500.xls	Model Run	Flood Officer 9

APPENDIX M – FLOOD EVENT LOG

	3:11 PM	BoM called to discuss with Engineer 2 about readings from Upper Brisbane & Lockyer. BoM & Engineer 2 are in agreement on readings.	Correspondence	Flood Officer 7
	3:19 PM	MBRC called. Engineer 2 advised her North Pine Dam will commence gates operations from 19:00 hrs.	Correspondence	Flood Officer 7
	4:00 PM	SDWD Model Updated - SDWD-201101061600.xls	Model Run	Flood Officer 9
	4:00 PM	NPD model updated - NPD-201101061600.xls	Model Run	
	6:57 PM	North Pine Dam Operator called to inform that MBRC workmen were waiting until 19:00 hrs to close Young's Crossing boom gates. This delayed dam gate opening by 15 minutes.	Correspondence	Flood Officer 1
	7:45 PM	Dam Operator 4 (Somerset Dam) called to enquire about the release strategy. Engineer 1 advised the impacts of the Lockyer flow were being monitored. Communication by e-mail was O.K.'ed.	Correspondence	Flood Officer 1
	9:00 PM	NPD model updated - NPD-201101062100.xls	Model Run	
	9:00 PM	SDWD Model Updated - SDWD-201101062100.xls	Model Run	Flood Officer 9
Saturday 8 January 2011	7:00 AM	Engineer 2 and Flood Officer 8 commenced day shift.	Other	Flood Officer 8
	8:00 AM	Advice from BoM indicates that SEQ can expect some high rainfall totals over the next 5 days up to Tuesday 11/1/11 with the largest falls predicted for Sunday and Monday.	Correspondence	Flood Officer 8
	8:00 AM	NPD model updated - NPD-201101070800.xls	Model Run	
	8:21 AM	Called Somerset Council to inform him that the Lockyer is running - all bridges in Somerset Region will be cut off this morning. Wivenhoe gates will be opened once the Lockyer peak is through.	Correspondence	Flood Officer 8
	8:40 AM	FOC called MBRC to inform them that North Pine will be operate for the next few days - probably till Tuesday.	Correspondence	Flood Officer 8
	8:44 AM	Called BCC to inform that Wivenhoe gates will be opened again this afternoon and releases might peak at 1500m ³ /s. This might continue until the end of next week.	Correspondence	Flood Officer 8
	8:47 AM	Called ICC to inform him that Wivenhoe gates will be opened again this afternoon and releases might peak at 1500m ³ /s. This might continue until the end of next week.	Correspondence	Flood Officer 8
	10:12 AM	Called BCC to provide situation report.	Correspondence	Flood Officer 8
	12:00 PM	NPD model updated - NPD-201101071200.xls	Correspondence	
	12:00 PM	SDWD Model Updated - SDWD-201101071200.xls	Model Run	Flood Officer 9
	3:02 PM	BCC called FOC with concerns that dam release will add another 200mm on top of abnormal high tide. Engineer 2 spoke to BoM who advised that the effect could be around 50mm - if that can be measured.	Correspondence	Flood Officer 8
	6:00 PM	SDWD Model Updated - SDWD-201101071800.xls	Model Run	Flood Officer 9
	7:55 AM	Dam Operator 2 from Somerset Dam rang enquiring on Somerset's strategy. Engineer 1 advised possibly opening a gate later today.	Correspondence	Flood Officer 3
8:10 AM	Engineer 1 advised Dam Operator 10 (Wivenhoe Dam) on directive #4 and discussed strategy.	Correspondence	Flood Officer 3	

APPENDIX M – FLOOD EVENT LOG

	8:20 AM	Engineer 1 rang North Pine Dam Operator and advised on strategy.	Correspondence	Flood Officer 3
	9:00 AM	SDWD Model Updated - SDWD-201101080900.xls	Model Run	Flood Officer 9
	9:00 AM	Dam Operator 2 (Somerset Dam) rang to advise he is going into Kilcoy to see the treatment plant and will be off-site for a couple of hours.	Correspondence	Flood Officer 3
	10:00 AM	NPD model updated - NPD-201101081000.xls	Model Run	Flood Officer 9
	10:50 AM	Dam Operations Manager rang. Engineer 1 advised current status and strategy.	Correspondence	Flood Officer 3
	11:30 AM	BCC rang asking about combined flows down the Brisbane River (Wivenhoe, Warrill Creek and Bremer River). Flood Officer 3 advised that at this stage flows would not exceed 1500m ³ /sec.	Correspondence	Flood Officer 3
	3:00 PM	NPD model updated - NPD-201101081500.xls	Correspondence	
	3:00 PM	SDWD Model Updated - SDWD-201101081500.xls, SDWD-201101081500-Forecast72hr.xls	Model Run	Flood Officer 9
Sunday 9 January 2011	6:50 AM	Dam Operations Manager rang. Engineer 4 advised Dam Operations Manager on current release strategy based on recent heavy overnight rainfall.	Correspondence	Flood Officer 1
	7:00 AM	SDWD Model Updated - SDWD-201101090700.xls	Model Run	Flood Officer 9
	8:40 AM	Engineer 2 called BoM regarding advice received that widespread rain was expected to continue in the catchment areas over the next 24 - 48 hours.	Correspondence	Flood Officer 1
	9:00 AM	SDWD Model Updated - SDWD-201101090900.xls	Model Run	Flood Officer 9
	9:00 AM	NPD model updated - NPD-201101090900.xls	Model Run	Flood Officer 9
	12:00 PM	SDWD Model Updated - SDWD-201101091200.xls	Model Run	Flood Officer 9
	12:00 PM	Engineer 1 scheduled meeting of Duty Engineers this afternoon to discuss current situation and forward release strategies.	Correspondence	Flood Officer 1
	2:00 PM	SDWD Model Updated - SDWD-201101091400.xls	Model Run	Flood Officer 9
	2:00 PM	NPD model updated - NPD-201101091400.xls	Model Run	Flood Officer 9
	2:30 PM	Flood Officer 1 called Dam Operator 2 (Somerset Dam) and requested status readings be faxed to the FOC on an hourly basis until advised otherwise. Current Somerset lake level is EL 100.54 and rising fast.	Correspondence	Flood Officer 1
	2:42 PM	FOC called North Pine Dam Operator advising of impending gate openings due to recent heavy rainfall and subsequent projected inflows.	Correspondence	Flood Officer 1
	3:00 PM	NPD model updated - NPD-201101091500.xls	Model Run	Flood Officer 9
	4:00 PM	SDWD Model Updated - SDWD-201101091600.xls	Model Run	Flood Officer 9
	4:15 PM	Engineer 2 called SRC advising that the current strategy was to maintain a flow in the Brisbane River such that the Fernvale Bridge and the Mount Crosby Bridge could be kept open. However, future rainfall could well impact on those roads remaining open. Closure next Tuesday is a real possibility at this stage.	Correspondence	Flood Officer 1

APPENDIX M – FLOOD EVENT LOG

4:20 PM	Engineer 2 phoned ICC advising that the current strategy was to maintain flow in the Brisbane River such that the Fernvale Bridge and the Mount Crosby Bridge could be kept open. However, future rainfall could well impact on those roads remaining open. Closure next Tuesday is a real possibility at this stage.	Correspondence	Flood Officer 1
4:25 PM	Engineer 2 called BCC. A message was left to phone FOC.	Correspondence	Flood Officer 1
4:26 PM	Engineer 2 called BCC. A message was left to phone FOC.	Correspondence	Flood Officer 1
4:27 PM	BCC returned phone call. BCC was advised by Engineer 2 that the current strategy was to maintain a flow in the Brisbane River such that the Fernvale Bridge and the Mount Crosby Bridge could be kept open. However, future rainfall could well impact on those roads remaining open. Closure next Tuesday is a real possibility at this stage. Flow in the Lower Brisbane potentially might reach 3,000 cumecs by next Wednesday or Thursday.	Correspondence	Flood Officer 1
5:18 PM	Flood Officer 1 left a message with Dam Operator 9 (A/Co-ord) regarding the potential for Fernvale Bridge and Mount Crosby Bridge to be closed, possibly from Tuesday. This may impact on staffing issues for both Wivenhoe and Somerset Dams during this flood event. Request for Dam Operator 9 to contact the FOC ASAP.	Correspondence	Flood Officer 1
5:25 PM	BCC returned call to Engineer 2. Engineer 2 advised potential for releasing up to 2,500 cumecs by Tuesday. With further heavy rainfall, as forecast, the flow in the Lower Brisbane could increase to 3,000 cumecs with potential for closure of Fernvale Bridge and Mount Crosby Bridge by Thursday (possibly Wednesday). Releases from Wivenhoe are dependant on flows from Lockyer Ck and inflow into Wivenhoe. FOC will continue to update BCC.	Correspondence	Flood Officer 1
5:32 PM	NPD Operator phoned the FOC with a manual reading of EL 20.660 at Lake Kurwongbah. He noted that should NPD gates be closed in the near future, the Lake Kurwongbah tailwater would impact on Youngs Crossing.	Correspondence	Flood Officer 1
5:40 PM	Dam Operations Manager phoned Engineer 2 for an update on the current situation.	Correspondence	Flood Officer 1
5:45 PM	Dam Operator 9 returned call and Flood Officer 1 advised that Engineer 2 had requested Dam Operator 9 to factor into his staffing roster of Wivenhoe and Somerset Dams the potential for the Fernvale bridge and the Mount Crosby Bridge to be closed from mid-week sometime, depending on the likelihood of further heavy rainfall.	Correspondence	Flood Officer 1
5:58 PM	Engineer 2 called BoM to discuss Wivenhoe Dam's release strategy i.e. Major bridge open strategy Vs increased inflow into Wivenhoe resulting from current heavy rainfall. Situation will become clearer in 24 hours time.	Correspondence	Flood Officer 1
6:00 PM	SDWD Model Updated - SDWD-201101091800.xls	Model Run	Flood Officer 9
6:00 PM	NPD model updated - NPD-201101091800.xls	Model Run	Flood Officer 9
6:35 PM	The caretaker from the house at the Colleges Crossing Reserve rang FOC to enquire about predicted flood height at the Colleges Crossing Bridge. Engineer 2 referred him to ICC for an update on flood information affecting the Ipswich area. Advised no change in Wivenhoe releases at this stage and the future options were presently unknown.	Correspondence	Flood Officer 1
7:00 PM	SDWD Model Updated - SDWD-201101091900.xls, SDWD-201101091900norain.xls, SDWD-201101091900withrain.xls	Model Run	Flood Officer 9
7:10 PM	FOC called SRC advising him that high releases from Wivenhoe (3000 cumecs) are expected to be necessary in view of heavy rain over the last 3 hours.	Correspondence	Flood Officer 6

APPENDIX M – FLOOD EVENT LOG

7:15 PM	FOC called Seqwater CEO advising him that high rainfall is expected overnight and releases from Wivenhoe causing damaging flooding are likely to be necessary.	Correspondence	Flood Officer 6
7:15 PM	FOC called Director Dam Safety advising him that FOC is now looking at much larger flows and will have to ramp up releases to around 3000 cumecs as by as early as midnight which is likely to have flooding impacts on low-lying areas of Brisbane.	Correspondence	Flood Officer 6
7:20 PM	Engineer 2 called BCC advising him of potential for high releases sooner than previously expected.	Correspondence	Flood Officer 6
7:25 PM	NPD Operator called to advise dam level is at 39.82mAHD, 3 gates are at increment 2 and two are at increment 1. The two at increment 1 are currently being raised to increment 2 (next few minutes).	Correspondence	Flood Officer 6
8:00 PM	SDWD Model Updated - SDWD-201101092000withnorain.xls	Model Run	Flood Officer 9
8:05 PM	Engineer 1 called NPD Operator to confirm last directive is completed. All gates at increment 2.	Correspondence	Flood Officer 6
8:30 PM	ICC returned call and spoke to Engineer 3. He was informed of current situation and the likelihood of high releases tomorrow causing flood damage.	Correspondence	Flood Officer 6
8:50 PM	Engineer 1 called BCC to request copy of flood damages curve from 2007 study. BCC will send a copy tomorrow.	Correspondence	Engineer 1
8:55 PM	BCC called back and spoke with Engineer 3. Confirmed BCC mobilisation triggers need to be in place. Status report is in preparation and will be emailed out shortly.	Correspondence	Flood Officer 6
9:10 PM	Dam Operations Manager called and spoke with Engineer 1. Dam Operations Manager confirmed that releases will need to be ramped up from current 1400 cumecs to 2500 cumecs which will cause flooding in low lying areas of Brisbane. Brisbane flood information centre has not yet been mobilised. Somerset RC has no DTMR A/H contacts and will be contacting them in the morning. Dam Operations Manager will locate DTMR contacts. Confirmed volumes getting close to 1974 levels. Confirmed situation report has gone out.	Correspondence	Flood Officer 6
9:15 PM	BoM called and spoke with Engineer 2. They discussed on rainfall expectations and flood warning requirements for Brisbane. Bremer/Warrill situation being monitored. Actual and projected flows sent to BoM.	Correspondence	Flood Officer 6
9:20 PM	ICC spoke with Engineer 1. Emailing DTMR A/H contact to flood room. Kiosk caretaker at Colleges Crossing is being evacuated.	Correspondence	Flood Officer 6
10:00 PM	SDWD Model Updated - SDWD-201101092200withnorain.xls, SDWD-201101092200-Forecast24hr.xls	Model Run	Flood Officer 9
10:00 PM	NPD model updated - NPD-201101092200.xls	Model Run	Flood Officer 9
10:00 PM	Engineer 3 called Wivenhoe operator (Dam Operator 7) and confirmed current flooding expectations based on rainfall predictions and expected impacts.	Correspondence	Flood Officer 6
10:15 PM	FOC called SRC. A situation update was provided. Fernvale Bridge closure likely to be required in view of probable releases from Somerset to Wivenhoe.	Correspondence	Flood Officer 6
10:20 PM	Dam Operations Manager called and spoke with Engineer 1. A teleconference with Water Grid Manager and DERM was completed. Explained 9:00pm situation report. Water Grid Manager will be distributing media release in the morning regarding closure of bridges.	Correspondence	Flood Officer 6

APPENDIX M – FLOOD EVENT LOG

	10:30 PM	Mt Crosby WTP Manager called and spoke with Engineer 1. He was concerned the guardrails need to be taken off bridge before bridge goes over. Engineer 1 recommended getting the rails straight off in view of increasing flow expectations overnight. Flow expected to get to 2000ML by morning.	Correspondence	Flood Officer 6
	10:30 PM	Engineer 3 called Wivenhoe Dam operator (Dam Operator 7) requesting for a visual inspection of Fernvale Bridge.	Correspondence	Flood Officer 6
	10:40 PM	Dam Operator 7 (Wivenhoe Dam) called discussed Fernvale Bridge situation with Engineer 3. Water was lapping the bridge girders.	Correspondence	Flood Officer 6
	10:45 PM	Dam Operations Manager called and spoke with Engineer 1. Dam Operations Manager will be contacting Dan Spiller to confirm closure of Mt Crosby Weir Bridge. Police are on site.	Correspondence	Flood Officer 6
	11:20 PM	Engineer 3 called ICC and left message regarding rates of rise at Mt Crosby. Bridge will be inundated within the next couple of hours.	Correspondence	Flood Officer 6
	11:25 PM	Engineer 3 called ICC regarding rates of rise at Mt Crosby (approx 200 mm from going over) - will be inundated within the next couple of hours. Confirmed more rain is on the way and releases will need to be increased.	Correspondence	Flood Officer 6
	11:25 PM	Engineer 1 spoke with Dam Operator 7 (Wivenhoe Dam). Water is up to the centreline of the Chine Gully approach to Fernvale Bridge. Esk Police are on site and are considering placing road closure signs in Fernvale. Dam operators living in Fernvale will be mobilised to the dam by Police prior to closure.	Correspondence	Flood Officer 6
	11:30 PM	Engineer 3 called SRC and left message advising of situation.	Correspondence	Flood Officer 6
	11:35 PM	Engineer 1 called DTMR and left message regarding current road closure situation.	Correspondence	Flood Officer 6
	11:35 PM	Engineer 3 called SRC and left message for call to be returned re Fernvale Bridge situation.	Correspondence	Flood Officer 6
	11:38 PM	Engineer 3 called SRC CEO and left message regarding Fernvale Bridge situation and requested call be returned ASAP.	Correspondence	Flood Officer 6
	11:40 PM	SRC called back and spoke with Engineer 3. Engineer 3 confirmed the high flow levels and anticipated further level rises will impact road crossings. Fernvale Bridge was about to go out. Informed of the levels and inflows to Wivenhoe and Somerset and the expectation for more rain.	Correspondence	Flood Officer 6
Monday 10 January 2011	12:00 AM	SRC called again and spoke with Engineer 3. Engineer 3 confirmed Police were on site at Fernvale Bridge and were contemplating road closure signs at Fernvale. Confirmed message has been left with DTMR but call not yet returned.	Correspondence	Flood Officer 6
	12:15 AM	Mt Crosby WTP Manager called to confirm Mt Crosby Weir road is closed (call taken by Flood Officer 6). Confirmed that ICC has been notified and message left with DTMR.	Correspondence	Flood Officer 6
	12:45 AM	BCC called and spoke with Engineer 3. Indicated that 3500 cumecs is the damaging flow level for Brisbane urban areas. The manual documents 4000 cumecs as the damaging level. Engineer 3 undertook to take this into consideration when preparing the current situation report, and would not refer to damage levels.	Correspondence	Flood Officer 6
	12:55 AM	Engineer 3 called Dam Operations Manager to discuss BCC's view on damaging flow. Engineer 3 confirmed that if flows were kept below 3500 the fuse plug would be triggered. Agreed that situation reports will not allude to damage levels - the councils can make decisions on what to report in this regard.	Correspondence	Flood Officer 6

APPENDIX M – FLOOD EVENT LOG

1:00 AM	SDWD Model Updated - SDWD-201101100100withnorain.xls	Model Run	Flood Officer 9
1:00 AM	Engineer 1 called Dam Operator 1 (Somerset Dam) regarding purported dam stability issues (via ICC - two reports received). Dam Operator 1 confirmed that inspection had revealed no issues.	Correspondence	Flood Officer 6
3:00 AM	SDWD Model Updated - SDWD-201101100300withnorain.xls	Model Run	Flood Officer 9
3:00 AM	NPD model updated - NPD-201101100300.xls	Model Run	Flood Officer 9
4:10 AM	Engineer 3 discussed Wivenhoe status and release strategy with Dam Operator 7.	Correspondence	Flood Officer 6
5:00 AM	SDWD Model Updated - SDWD-201101100500withnorain.xls	Model Run	Flood Officer 9
5:00 AM	Dam Operator 4 called and discussed Somerset situation with Engineer 1.	Correspondence	Flood Officer 6
5:00 AM	NPD model updated - NPD-201101100500.xls	Model Run	Flood Officer 9
5:05 AM	Dam Operations Manager called and received situation update from Engineer 3.	Correspondence	Flood Officer 6
5:20 AM	Engineer 1 called BoM regarding next forecast update - due at 9:00 am.	Correspondence	Flood Officer 6
6:00 AM	Send out situation report for this morning.	Correspondence	Flood Officer 8
7:40 AM	Talked to BoM - we are in general agreement about current flows in the Brisbane River.	Correspondence	Flood Officer 8
8:30 AM	FOC left a message for BCC to call back.	Correspondence	Flood Officer 8
8:38 AM	Talked to BoM to discuss our planned strategy i.e. to maintain gate openings for the next 24 hrs. This increases flood storage by 75 000ML which is equivalent to 0.2m rise and limits flows in the Brisbane to 3 000 m ³ /s this provides a buffer for potential runoff for the next 24 hrs.	Correspondence	Flood Officer 8
9:38 AM	Conference call with BCC - informed them that release from Wivenhoe will be maintained at 2000m ³ /s for the next 24 hrs. This will be revised in 24 hrs. The strategy is to limit the flows to 3000 - 3500m ³ /s. At 3500m ³ /s about 322 (the whole property) will be submerged and about 7000 properties will be affected somehow damage bill \$7mil). If the rainfall in the Bremmer and Lockyer increases substantially - it is likely the flows from these catchments can peak at 1000m ³ /s (on top of Wivenhoe release)	Correspondence	Flood Officer 8
10:08 AM	Received QPF - 100mm in Brisbane and 150mm North Pine catchment	Other	Flood Officer 8
10:15 AM	Received phone call from EMQ and Logan/Scenic Rim District Disaster Coordinator - gave them the same information as what we gave BCC before.	Correspondence	Flood Officer 8
10:46 AM	BoM to inform that Engineer 2 can do the model and with 600m ³ /s in the Bremmer the flows in Brisbane will go up to 3600m ³ /s. BoM will discuss with BCC.	Correspondence	Flood Officer 8
11:14 AM	ICC called to clarify our strategy. Gave him the same info as above.	Correspondence	Flood Officer 8
1:00 PM	SDWD Model Updated - SDWD-201101101300withnorain.xls	Model Run	Flood Officer 9
12:02 PM	Spoke with Seqwater CEO to answer elaborate on Situation Report and inform him of large rainfalls currently occurring in the Wivenhoe catchment.	Correspondence	Flood Officer 8

APPENDIX M – FLOOD EVENT LOG

12:33 PM	Called BCC twice. No answer, left messages.	Correspondence	Flood Officer 8
12:36 PM	Spoke with ICC, informed them that we are moving strategy from urban damage control to dam safety priority	Correspondence	Flood Officer 8
12:41 PM	NPD operator called to inform FOC the level is dropping. Instructed them not to close gates - heavy rain fell in catchment.	Correspondence	Flood Officer 8
2:00 PM	Send out third situation report for today.	Correspondence	Flood Officer 8
2:30 PM	Called BCC 3 times before getting through to Flood Information Centre (FIC). Discussed latest strategy with them i.e. changing from "Flood Mitigation" to "Dam Safety". We will start opening Wivenhoe gates from 15:00.	Correspondence	Flood Officer 8
3:00 PM	Called Disaster Coordinator. No answer.	Correspondence	Flood Officer 8
4:00 PM	NPD model updated - NPD-201101101600.xls	Model Run	Flood Officer 9
3:15 PM	Had conference call with BoM. They agree with FCC on model discharge results. However, BoM included 6hrs of additional rain which takes the discharge to 4600m3/s	Correspondence	Flood Officer 8
4:09 PM	Engineer 2 spoke to a Police Officer about Cressbrook Dam - advising that FOC does not manage Cressbrook but gave him a contact at Toowoomba RC	Correspondence	Flood Officer 8
5:00 PM	SDWD Model Updated - SDWD-201101101700withnorain.xls, SDWD-201101101700with50mmrain.xls	Model Run	Flood Officer 9
5:09 PM	Dam Operator 2 phoned and reported water from Wivenhoe in getting into the hydro	Correspondence	Flood Officer 8
6:06 PM	Get weather update from BoM - the forecast now is - still more of the same of what we had today.	Other	Flood Officer 8
6:45 PM	North Pine Dam operator raised concerns with school groups using Lake Kurwongbah for rowing exercise while water is running over the spillway at 500mm. He was referred to Rangers.	Correspondence	Flood Officer 8
7:30 PM	Dam Operator 2 (Somerset) called to inform that Somerset hydro is inundated with water. He believes he has located source of leak, has tightened seals to prevent further leakage. He also noted that there is oil in the water.	Correspondence	Flood Officer 9
8:00 PM	SDWD Model Updated - SDWD-201101102000withnorain.xls, SDWD-201101102000-Lockyer.xls, SDWD-201101102000-TMinflows.xls	Model Run	Flood Officer 9
20:00 PM	BoM called to advise of situation regarding flows in Lockyer. Estimated very heavy localised rainfall (eg. 600mm in few hours) on Toowoomba escarpment to cause observed flood flooding. Will monitor via Glenore Grove gauging station.	Correspondence	Flood Officer 9
20:45 PM	Seqwater Mt Crosby WTP Manager called to get situation update. Advised that at 20m there will be issues at Mt Crosby WTP. FOC to advise WTP Manager if likely to reach that level.	Correspondence	Flood Officer 9
21:00 PM	Spoke to Director Dam Safety regarding strategies for reducing Wivenhoe release to mitigate latest event in Lockyer. He endorsed variation to manual to operate at minimum gate settings to create gap to allow peak of flash flood to pass. Also endorsed concept allowing Wivenhoe HW to rise above 74 mAHD briefly.	Correspondence	Flood Officer 9
21:30 PM	Provided ICC with situation update.	Correspondence	Flood Officer 9
20:20 PM	Spoke to BoM regarding reducing Wivenhoe release to accommodate peak of Lockyer flash flood.	Correspondence	Flood Officer 9

APPENDIX M – FLOOD EVENT LOG

	11:20 PM	Spoke to Dam Operations Manager to give situation update. He agreed that if possible to reduce flow from Wivenhoe to accommodate Lockyer flash flood peak.	Correspondence	Flood Officer 9
Tuesday 11 January 2011	12:00 AM	SDWD Model Updated - SDWD-201101110000withnorain.xls	Model Run	Flood Officer 9
	12:00 AM	NPD model updated - NPD-201101110000.xls	Model Run	Flood Officer 9
	12:15 AM	Spoke to BCC to update on current release strategy.	Correspondence	Flood Officer 9
	1:30 AM	Spoke to SRC. Somerset Regional Council offices were flooded and email addresses are no longer working. Tony can be emailed on an alternative email address, which has been recorded.	Correspondence	Flood Officer 9
	2:15 AM	BCC called to confirm forecast peak height of 3.1m at Brisbane city gauge for Wednesday high tide. This is based on 4600 cumecs modelled by BoM. Provided James with update on current release strategy.	Correspondence	Flood Officer 9
	3:00 AM	SDWD Model Updated - SDWD-201101110300withnorain.xls	Model Run	Flood Officer 9
	3:15 AM	BCC has provided inundation forecast for Brisbane city to assist with devising strategy to manage Wivenhoe releases	Correspondence	Flood Officer 9
	5:15 AM	Spoke to BoM regarding reducing Wivenhoe release to accommodate peak of Lockyer flash flood. Update: Consensus was that reducing release from Wivenhoe would no longer be feasible due to attenuation of Lockyer peak and significant additional rainfall in upper Brisbane during the night.	Correspondence	Flood Officer 9
	7:00 AM	SDWD Model Updated - SDWD-201101110700withnorain.xls	Model Run	Flood Officer 9
	7:00 AM	NPD model updated - NPD-201101110700.xls	Model Run	Flood Officer 9
	7:20 AM	Engineer 2 called Seqwater CEO to appraise of latest situation of Wivenhoe and lower Brisbane	Correspondence	Flood Officer 4
	7:22 AM	Engineer 2 called BoM to appraise of situation. BoM unable to talk and will call back.	Correspondence	Flood Officer 4
	7:35 AM	BoM called back. Full appraisal of Seqwater strategy. Both Seqwater and BoM models results were discussed in detail, and generally agreed with each other.	Correspondence	Flood Officer 4
	7:51 AM	Called Dam Operator 10 (Wivenhoe Dam) advised that gates opening at Wivenhoe are imminent.	Correspondence	Flood Officer 4
	7:56 AM	Engineer 2 called BoM. Advised BoM that Wivenhoe will ramp up to a minimum release of 3700m ³ /s.	Correspondence	Flood Officer 4
7:59 AM	Engineer 4 called Seqwater CEO and advised that releases from Wivenhoe will reach 3700m ³ /s at a minimum, and BoM has been informed. Likely to affect Moggill 24 hours later. Phone call terminated due to bad connection.	Correspondence	Flood Officer 4	
8:01 AM	Seqwater CEO returned call. Engineer 4 advised that model to be run for BoM first and results to be past to BoM and BCC immediately. Rain likely to continue today	Correspondence	Flood Officer 4	
8:05 AM	NPD Operator informed that levels are still rising and another directive is required. Engineer 4 advised to proceed as per operations manual.	Correspondence	Flood Officer 4	
8:09 AM	Advised Dam Operator 10 (Wivenhoe Dam) that Wivenhoe Directive was coming through in a matter of minutes.	Correspondence	Flood Officer 4	

APPENDIX M – FLOOD EVENT LOG

8:10 AM	Engineer 4 called Director Dam Safety to advise of current Wivenhoe situation - Will exceed EL74m. Ramping up gate opening to a minimum of 3700 and gate operations will progress.	Correspondence	Flood Officer 4
8:11 AM	Engineer 2 called BCC flood information centre (Duty Officer). Wivenhoe releases will reach 3700m3/s at a minimum and higher flows are possible.	Correspondence	Flood Officer 4
8:15 AM	Engineer 4 called Dam Operations Manager to advise of the situation that Wivenhoe will increase to 3700m3/s as a minimum.	Correspondence	Flood Officer 4
8:16 AM	Engineer 2 called SRC and left a message.	Correspondence	Flood Officer 4
8:20 AM	Engineer 4 Called Dam Operator 10 (Wivenhoe Dam) and advised more gate opening directives are coming.	Correspondence	Flood Officer 4
8:21 AM	Engineer 2 called ICC to advise of situation and that Wivenhoe releases to be at a minimum of 3700m3/s	Correspondence	Flood Officer 4
8:25 AM	Engineer 4 called North Pine Dam operator. Verbal directive to open gates, faxed directive to follow before 9am.	Correspondence	Flood Officer 4
8:50 AM	Seqwater CEO called Engineer 2 mobile requesting 'worst case' scenario	Correspondence	Flood Officer 4
8:50 AM	Dam Operator 7 from Wivenhoe called informing that Wivenhoe has lost power, high voltage fuse blown. Hydro outlet is shut off.	Correspondence	Flood Officer 4
9:09 AM	Engineer 4 called Seqwater Tactical Maintenance Planner, advised that Wivenhoe has lost power, possibly blown high voltage fuses. Maintenance Planner to resolve issue.	Correspondence	Flood Officer 4
9:12 AM	NPD Operator called, NPD at 40.140 m HAD all gates at 6, currently heading to setting 7.	Correspondence	Flood Officer 4
9:13 AM	Energex called. All incoming power has been lost at Wivenhoe.	Correspondence	Flood Officer 4
9:16 AM	Engineer 4 called MBRC and left message: very large inflows into North Pine Dam has resulted in steep gate openings. Flood downstream can be expected	Correspondence	Flood Officer 4
9:17 AM	Engineer 4 called MBRC and informed that very large inflows into North Pine Dam have resulted in steep gate openings. Flood downstream can be expected. Strathpine Rd (Old Gympie Rd) to be flooded within next hour.	Correspondence	Flood Officer 4
9:21 AM	Dam Operator 2 from Somerset called Engineer 2. Water ingress through doors at the bottom of dam	Correspondence	Flood Officer 4
9:22 AM	Engineer 4 advised NPD Operator that Strathpine Rd is expected to be closed.	Correspondence	Flood Officer 4
9:26 AM	Engineer 4 advised NPD Operator verbally that all gates can go to 9 increments based on water level as per manual.	Correspondence	Flood Officer 4
9:40 AM	Engineer 2 called Flood Officer 7 and requested a technically knowledgeable person be dispatched to test HF radio links and satellite phone are in working condition	Correspondence	Flood Officer 4
9:51 AM	Voicemail: Tactical Maintenance Planner left message. He's contacted Energex and Energex suspect a dirty feed. Currently all helicopters are grounded. Specialist Trade Technician is lead at Mt Crosby. Energex will get as close as they can and get helicopter lift when possible.	Correspondence	Flood Officer 4
10:00 AM	NPD model updated - NPD-201101111000.xls	Model Run	Flood Officer 9

APPENDIX M – FLOOD EVENT LOG

10:25 AM	North Pine Dam Operator called to report Lake level at EL 40.490mAHD. All gates currently at setting No. 10.	Correspondence	Flood Officer 4
10:29 AM	Stan from Seqwater called Engineer 2. In conference with Principal Dams and Weirs Planning. Internal questioning of release strategy. Internal discussion regarding current approved strategy.	Correspondence	Flood Officer 4
10:45 AM	Engineer 4 advised MBRC of current situation.	Correspondence	Flood Officer 4
10:54 AM	Dam Operations Manager called. Bad line and disconnected.	Correspondence	Flood Officer 4
11:00 AM	SDWD Model Updated - SDWD-201101111100withnorain.xls	Model Run	Flood Officer 9
11:01 AM	Message received by Engineer 4. Kilcoy Police rang Somerset, Engineer 4 advised general status information to be provided by dam operators, predictions to go through FOC.	Correspondence	Flood Officer 4
11:02 AM	Seqwater CEO requested update on situation.	Correspondence	Flood Officer 4
11:04 AM	Engineer 4 called Dam Operator 7. Discussed that if forecast rain falls, fuse plug likely to go.	Correspondence	Flood Officer 4
11:06 AM	FAX not working at Wivenhoe!	Other	Flood Officer 4
11:07 AM	BoM called. Inflow into NPD of 1500cumecs. Advised Wivenhoe strategy to be revised.	Correspondence	Flood Officer 4
11:17 AM	Principal Dams and Weirs Planning called Engineer 2 - on the way to talk to Grid Manager. Engineer 2 advised current strategy is 3 hourly.	Correspondence	Flood Officer 4
11:19 AM	Engineer 4 called MBRC. Advised North Pine still rising. Current releases to exceed 2000cumecs.	Correspondence	Flood Officer 4
11:30 AM	North Pine Dam operator called to report lake level EL 40.740 mAHD. Water level rising slowly. All gates now at setting 14.	Correspondence	Flood Officer 4
11:38 AM	Engineer 2 called BoM. Unable to contact BoM. Will call back.	Correspondence	Flood Officer 4
11:38 AM	Engineer 4 called Seqwater CEO and advised that releases at Wivenhoe will be ramped up to 4000cumecs and strategy will be revised on an hourly basis. In reality releasing slightly less than the Flood Ops manual.	Correspondence	Flood Officer 4
11:51 AM	Incoming Phone call from Engineer 1. Advised SS that Wivenhoe will ramp up to 4000cumecs. Also advised that staff likely to stay in offices overnight.	Correspondence	Flood Officer 4
11:56 AM	Engineer 4 called MBRC and left message again. Outflow will exceed 2000cumecs	Correspondence	Flood Officer 4
11:57 AM	Engineer 4 called MBRC. Left message: North Pine Dam outflow likely to exceed 2000cumecs.	Correspondence	Flood Officer 4
11:59 AM	Engineer 4 called MBRC. Left message, outflow from North Pine Dam will exceed 2000cumecs.	Correspondence	Flood Officer 4
12:04 PM	North Pine Dam Operator called to report lake level at EL 40.883 mAHD. Gates are currently set at setting 16.	Correspondence	Flood Officer 4
12:10 PM	Flood Officer 2 called from FOC satellite phone. Made contact with Somerset and North Pine. Connection issues with Landline to Wivenhoe.	Correspondence	Flood Officer 4
12:17 PM	MBRC called. Engineer 2 advised discharge in excess of 1989 flood (1500cumecs). Current releases in excess of 2000cumecs.	Correspondence	Flood Officer 4

APPENDIX M – FLOOD EVENT LOG

12:30 PM	North Pine Dam Operator called to report lake level is now at EL 40.950m AHD and rising. Gate settings at 17.	Correspondence	Flood Officer 4
12:42 PM	Redlands Shire Council called requesting information for Lesley Harrison. Was told to call Operations Coordinator South.	Correspondence	Flood Officer 4
12:42 PM	Call from Mary Valley Lead Operator. Asked what is required of the Northern dams. Was advised to monitor dams more closely when/if 1 in 50 year event occurs.	Correspondence	Flood Officer 4
1:02 PM	North Pine Dam Operator called to report Lake level EL 41.040 m AHD. Gate settings at setting 18.	Correspondence	Flood Officer 4
1:26 PM	Seqwater CEO called and requested the FOC request the BoM to consider if Wivenhoe is releasing 9000cumecs.	Correspondence	Flood Officer 4
1:44 PM	North Pine Dam called on Satellite phone to confirm it is operational.	Correspondence	Flood Officer 4
1:50 PM	North Pine Dam Operator called to report lake level at EL 41.105m AHD. Gates currently at setting 19.	Correspondence	Flood Officer 4
1:56 PM	Dam Operations Manager requesting status update.	Correspondence	Flood Officer 4
2:00 PM	SDWD Model Updated - SDWD-201101111400withnorain.xls	Model Run	Flood Officer 9
2:24 PM	Seqwater Wivenhoe Admin Officer called to pass on message. QLD Fire Rescue called to enquire about Wivenhoe Releases. Unable to call at this stage.	Correspondence	Flood Officer 4
2:37 PM	Seqwater CEO called to discuss current situation.	Correspondence	Flood Officer 4
2:46 PM	North Pine Dam Operator called to report lake level steady at 41.110 for last 30 minutes.	Correspondence	Flood Officer 4
2:53 PM	North Pine Dam is isolated as per conversation with operator.	Correspondence	Flood Officer 4
3:00 PM	NPD model updated - NPD-201101111500.xls	Model Run	Flood Officer 9
3:06 PM	Manager WTP Operations North (Seqwater) called to enquire about the current release rate from Wivenhoe Dam.	Correspondence	Flood Officer 4
3:14 PM	Seqwater CEO called to discuss the proposed release of 10,000cumecs. Engineer 4 and Engineer 2 explained release strategy is constantly being revised.	Correspondence	Flood Officer 4
3:49 PM	BoM had a conference with Engineer 1, 2, 3 and 4 about current release strategy and possible maximum release scenario of 10000m ³ /s. This would be of a similar magnitude to the 1893 event (~8.36m in Brisbane Port Office)	Correspondence	Flood Officer 4
3:54 PM	Manager WTP Operations North (Seqwater) called and talked to Engineer 4 regarding current inflow strategy.	Correspondence	Flood Officer 4
3:58 PM	Called NPD Operator (at Wivenhoe Dam) to check if all is ok, levels are slowly reducing.	Correspondence	Flood Officer 4
4:29 PM	Lowood Police rang to request water level of Wivenhoe and discuss the current release strategy with respect to the fuse plug (conversed with Flood Officer 9).	Correspondence	Flood Officer 4
4:33 PM	Phone call with Engineer 2 and Seqwater CEO. Discussed that even though the magnitude flood in Brisbane is similar to 1974 flood event, the no-dam flood would be significantly larger without Wivenhoe.	Correspondence	Flood Officer 4
4:41 PM	Director Dam Safety phone call. He requested more technical information in the status reports released by Duty Engineers. Director Dam Safety will send through an example of the technical data requested in the report.	Correspondence	Flood Officer 4

APPENDIX M – FLOOD EVENT LOG

4:46 PM	Principal Incident and Emergency Management (Seqwater) called to request update in inflow/outflow of Wivenhoe Dam.	Correspondence	Flood Officer 4
5:00 PM	SDWD Model Updated - SDWD-201101111700withnorain.xls	Model Run	Flood Officer 9
5:12 PM	Engineer 4 called North Pine Dam operator regarding gate operating strategy. Engineer 4 advised to keep gates at current setting until water is clear of the controls. Gate closing strategy then to follow Flood Manual	Correspondence	Flood Officer 4
5:22 PM	BoM, Engineer 2 and Engineer 3 discussed current Wivenhoe inflows and anticipated outflows. Engineer 2 confirmed that 7500cumecs is still likely early tonight.	Correspondence	Flood Officer 4
5:27 PM	North Pine Dam operator called to report of NPD level EL 40.7 m AHD. Engineer 4 verbally advised 10 minute gate closure intervals is ok until 39.9 m AHD - then back to 15 min intervals.	Correspondence	Flood Officer 4
5:48 PM	Dam Operations Manager asking Tarong Energy to hold off releasing water from Splityard Creek.	Correspondence	Flood Officer 4
6:00 PM	NPD model updated - NPD-20110111800.xls, NPD-20110111800 Final.xls	Model Run	Flood Officer 9
6:00 PM	SDWD Model Updated - SDWD-201101111800withnorain.xls	Model Run	Flood Officer 9
6:04 PM	Mary Valley Lead Operator called to advise he is unable to reach Lake Macdonald to take readings.	Correspondence	Flood Officer 4
6:07 PM	Recap of current release strategy amongst Duty Engineers. Current Wivenhoe scenario: 74.9 m - all gates at 12m. Won't go to 13m settings until level reaches 75.0 m AHD.	Correspondence	Flood Officer 4
6:35 PM	Dam Operator 2 (Somerset Dam) called to confirm all is good.	Correspondence	Flood Officer 4
6:36 PM	Bill Stevens called to inform team he is cut off due to flood waters and unable to come in.	Correspondence	Flood Officer 4
6:41 PM	Tarong Energy confirmed releases from Splityard creek have stopped.	Correspondence	Flood Officer 4
6:56 PM	Daryl Hicky informed that tailwater gauge appears to be OOA. Confirmed by Engineer 2.	Correspondence	Flood Officer 4
7:00 PM	Spoke to NPD operator who confirmed that North Pine gate settings were at 17, with level of 40.5. Closing sequence was still to close in 10 minute increments down to level 39.9, at which time increments would increase to 15 minutes.	Correspondence	Flood Officer 9
7:10 PM	NPD Operator rang, is concerned that the level is dropping too fast.	Correspondence	Flood Officer 3
7:30 PM	Dam Operator 7 (Wivenhoe Dam) called to report that Wivenhoe Level 74.97mAHD is holding.	Correspondence	Flood Officer 3
7:30 PM	North Pine Dam Operator rang to say he is behind in gate settings.	Correspondence	Flood Officer 3
7:25 PM	Engineer 3 called North Pine Dam Operator to advise that a directive will be sent to move all gates down to 11m.	Correspondence	Flood Officer 3
7:45 PM	North Pine Dam Operator called FOC. Engineer 4 clarified directive 19 to drop gates from 16 to 11 in one go, at 15 minutes intervals.	Correspondence	Flood Officer 3
8:00 PM	BoM rang. Unofficially Engineer 2 advised that things have stabilised. Also advised predicted peaks at various sites.	Correspondence	Flood Officer 3

APPENDIX M – FLOOD EVENT LOG

8:25 PM	Tactical Maintenance Planner rang to advise that the high voltage feeder to Wivenhoe will not be restored for the duration of this event. Engineer 4 advised that Wivenhoe is operating successfully on the generator, and they have a fair bit of diesel. There are still 2 other backups to operate the gates.	Correspondence	Flood Officer 3
8:25 PM	Colliers Building Services rang back. Engineer 1 asked about power supply to 179 Turbot Street. Colliers Building Services said to email our power requirements.	Correspondence	Flood Officer 3
8:30 PM	Dam Operator 7 (Wivenhoe Dam) called to advise that Wivenhoe's level is 5mm down.	Correspondence	Flood Officer 3
8:30 PM	Engineer 1 called Colliers Building Services and left a message to call back (regarding loss of power to the 179 Turbot Street)	Correspondence	Flood Officer 3
8:30 PM	Engineer 1 rang SunWater to advise that power will be shutting down in the CBD tomorrow morning.	Correspondence	Flood Officer 3
8:35 PM	Engineer 1 rang SunWater to advise the power situation.	Correspondence	Flood Officer 3
8:35 PM	Seqwater CEO called FOC to speak with all duty engineers on the operating strategies for Wivenhoe releases.	Correspondence	Flood Officer 3
8:40 PM	Flood Officer 7 called FOC to ensure we received the Energex message regarding power shutdown to the CBD.	Correspondence	Flood Officer 3
8:45 PM	SunWater rang. Engineer 1 advised that Energex will be cutting power to the CDD in the morning. SunWater will call Mike Minter and the security guys for Mineral House.	Correspondence	Flood Officer 3
8:50 PM	North Pine Dam Operator called to report NPD Level at EL 40.07m AHD. Gates are all at 11 increments.	Correspondence	Flood Officer 3
8:55 PM	Seqwater CEO rang asking about possibly reducing releases. Engineer 2 advised that we are seriously considering it, but this would have little effect on the levels in Brisbane River. CEO would like technical reports every hour throughout the night.	Correspondence	Flood Officer 3
9:00 PM	Engineer 1 emailed Colliers Building Services with our building power requirements.	Correspondence	Flood Officer 3
9:05 PM	Engineer 2 rang BoM to advise that power to the CBD may be cut and send him actual and releases report.	Correspondence	Flood Officer 3
9:10 PM	SunWater called Engineer 1. SunWater advised he spoke to Colliers Building Services and is getting an Energex contact.	Correspondence	Flood Officer 3
9:20 PM	SunWater rang. Mike Minter told them we may not be able to have air conditioning.	Correspondence	Flood Officer 3
9:25 PM	Engineer 1 called SunWater. Colliers Building Services got back to him and has Haywoods Electrical lined up for tomorrow morning.	Correspondence	Flood Officer 3
9:30 PM	North Pine Dam Operator called. They are still behind in gate closures.	Correspondence	Flood Officer 3
9:35 PM	Engineer 4 rang to discuss the latest directive to raise Wivenhoe Dam. Engineer 4 suggested not raising.	Correspondence	Flood Officer 3
9:40 PM	Flood Officer 9 called Dam Operator 7 (Wivenhoe Dam) to obtain a current level. EL 74.9? Gates have been raised to 11.5m.	Correspondence	Flood Officer 3
10:00 PM	SDWD Model Updated - SDWD-201101112200withnorain.xls	Model Run	Flood Officer 9
10:00 PM	SunWater rang to advise the phone number for Steve from Energex 0418 186 814.	Correspondence	Flood Officer 3

APPENDIX M – FLOOD EVENT LOG

Wednesday 12 January 2011	10:00 PM	SunWater rang requesting Engineer 1 mobile number to pass on onto Energex.	Correspondence	Flood Officer 3
	10:30 PM	SunWater rang to say Geoff White has pleaded our case with the CEO of Energex and it is likely 179 Turbot Street will not lose power.	Correspondence	Flood Officer 3
	10:35 PM	Dam Operator 7 (Wivenhoe Dam) called to report lake level of 74.94mAHD @ 10:30hrs.	Correspondence	Flood Officer 3
	11:00 PM	Dam Operator 7 (Wivenhoe Dam) called to report lake level of 74.92mAHD @ 11:00hrs.	Correspondence	Flood Officer 3
	11:10 PM	Dam Operations Manager rang to request discharge from Wivenhoe when the gates are lowered to 10m. Advised 6100m ³ /sec.	Correspondence	Flood Officer 3
	11:30 PM	Flood Officer 9 called Dam Operator 7 (Wivenhoe Dam) to obtain a current level. EL 74.9? Gates have been raised to 11.5m.	Correspondence	Flood Officer 3
	12:30 AM	Dam Operator 7 (Wivenhoe Dam) called to report lake level of 74.88mAHD @ 12:30hrs.	Correspondence	Flood Officer 3
	1:00 AM	SunWater called to provide Energex contact details. Energex indicated that they didn't believe 179 Turbot St would be disconnected from power grid in the morning.	Correspondence	Flood Officer 9
	1:15 AM	Engineer 1 rang Dam Operator 7 (Wivenhoe Dam) advising next directive. We want to get releases down as quick as possible while still lowering lake levels. Advised that we may possibly have a communications problem in the morning if power to 179 Turbot Street is cut.	Correspondence	Flood Officer 3
	2:10 AM	BCC rang enquiring about a release strategy. Advised one will be issued at about 3:00am. Talked about the activities of the last 24 hours.	Correspondence	Flood Officer 3
	3:10 AM	Engineer 3 rang NPD Operator and advised no changes to gate settings planned for the next hour or so.	Correspondence	Flood Officer 3
	3:30 AM	Seqwater Mt Crosby WTP Manager called enquiring about levels at Mt Crosby.	Correspondence	Flood Officer 3
	3:50 AM	Engineer 1 called BoM advising him that because inflows are not as much as earlier anticipated, the releases from Wivenhoe are less than previously suggested.	Correspondence	Flood Officer 3
	4:05 AM	OIC of Lowood Police rang enquiring about the Wivenhoe fuse plug. Flood Officer 9 advised that there is no danger of the fuse plug failing, and that current releases from Wivenhoe Dam are about 4,900 cumecs.	Correspondence	Flood Officer 3
	4:40 AM	Seqwater Mt Crosby WTP Manager rang to check that his emails with the Mt Crosby levels were being received. They are.	Correspondence	Flood Officer 3
	5:15 AM	Dam Operations Manager rang enquiring current storage levels and releases. Engineer 3 advised.	Correspondence	Flood Officer 3
5:30 AM	Dam Operations Manager rang enquiring estimated time for closing North Pine Dam. Engineer 1 advised possible today, but it has not yet been decided. Also advised the inflows into North Pine Dam were equivalent to a 1:10,000 event.	Correspondence	Flood Officer 3	
5:30 AM	Engineer 3 called Wivenhoe Dam for the current level. Dropped 2 cm in 30 minutes.	Correspondence	Flood Officer 3	
5:50 AM	Engineer 2 called BoM advising him that we have significantly scaled back releases from Wivenhoe Dam, and will probably continue to scale back more. Agreed that Savages Crossing has peaked.	Correspondence	Flood Officer 3	

APPENDIX M – FLOOD EVENT LOG

6:00 AM	SDWD Model Updated - SDWD-201101120600withnorain.xls	Model Run	Flood Officer 9
6:00 AM	North Pine Dam rang enquiring about closing down. Engineer 4 advised that we have not yet decided.	Correspondence	Flood Officer 3
6:10 AM	Dam Operations Manager rang and suggested that the fish recovery may be a fairly big job. Engineer 4 suggested that our staff can check this morning and then decide.	Correspondence	Flood Officer 3
6:15 AM	BCC rang enquiring the level of the pump station at Mt Crosby. Engineer 4 said we can't help, but that he should contact the treatment plant Manager.	Correspondence	Flood Officer 3
6:30 AM	Engineer 4 rang Dam Operator 7 (Wivenhoe Dam) advising that a directive will soon follow to lower gates to 5m.	Correspondence	Flood Officer 3
6:35 AM	Paul Martin rang. Engineer 4 discussed current strategy.	Correspondence	Flood Officer 3
7:00 AM	Liaised with Bureau regarding expected peak in lower Brisbane.	Correspondence	Flood Officer 9
7:50 AM	SunWater called to confirm that 179 Turbot St had power.	Correspondence	Flood Officer 9
8:20 AM	Dam Operations Manager rang enquiring current storage levels and releases. Engineer 4 advised.	Correspondence	Flood Officer 2
9:20 AM	North Pine Dam Operator rang wanting to speak to Engineer 4.	Correspondence	Flood Officer 2
9:50 AM	Lowood Police rang enquiring current storage releases from Wivenhoe Dam. Engineer 4 advised.	Correspondence	Flood Officer 2
10:20 AM	Dam Operator 2 (Somerset Dam) called querying whether FOC have received fax and email regarding storage level. He was checking the walls before and will be at his desk for the next 30 minutes. Dam Operator 13 is there with him.	Correspondence	Flood Officer 2
10:50 PM	Seqwater rang wanting to thank Flood Officer 1 for his and John's heroic effort in clearing Seqwater basement.	Correspondence	Flood Officer 2
11:20 AM	Flood Officer 7 called to inform that he and Senior Hydrographer (Seqwater) are not able to access Enviromon. He asked if Engineer 2 can check the system.	Correspondence	Flood Officer 2
11:50 AM	Seqwater CEO called to ask that all communications be forwarded to him.	Correspondence	Flood Officer 9
12:20 PM	Flood Officer 1 called Dam Operator 10 (Wivenhoe Dam) to advise that Seqwater comms are to be switched off due to flooding of the Margaret Street offices. Please send all future hourly bulletins to the FOC via fax, or alternatively, phone or TPG link.	Correspondence	Flood Officer 1
12:25 PM	Flood Officer 1 called North Pine Dam advising that Seqwater comms are to be switched off due to flooding of the Margaret Street offices. Please send all future hourly bulletins to the FOC via fax, or alternatively, phone or TPG link.	Correspondence	Flood Officer 1
12:32 PM	Leslie Harrison Dam Operator called Engineer 4. Due to the failure of Seqwater comms, he was seeking direction on how to submit a final report on operations at approx. 1600 today. Engineer 4 said to phone in to the FOC.	Correspondence	Flood Officer 1
12:55 PM	BoM visited FOC to liaise with the Duty Engineers.	Correspondence	Flood Officer 1
1:10 PM	Principal Dams and Weirs Planning called to request electronic copy of Wiv - Som Flood Ops manual to be forwarded to him.	Correspondence	Flood Officer 1

APPENDIX M – FLOOD EVENT LOG

1:15 PM	Dam Operator 10 (Wivenhoe Dam) called to report lake level: 74.79mAHD @13:00hrs. Note: Reading taken in surging water. Wivenhoe fax appears to have failed.	Correspondence	Flood Officer 1
2:05 PM	North Pine Dam Operator called to inform that North Pine level was 39.74mAHD and based on this level he is recommending at least one gate closure.	Correspondence	Flood Officer 1
2:10 PM	Dam Operator 9 phoned from Wivenhoe Dam. The SES (and irrigators) at Fernvale have concerns that a flood peak might be coming down the Lockyer within the next couple of hours. Engineer 1 assured Graham that the flood heights have reduced by up to 3 metres and any increase would be less than 1 metre.	Correspondence	Flood Officer 1
2:25 PM	Dam Operator 10 (Wivenhoe Dam) called to report lake level: 74.81mAHD @14:00hrs. Note: Reading taken in surging water. Wivenhoe fax confirmed as failed.	Correspondence	Flood Officer 1
2:30 PM	North Pine Dam Operator called to advise that the automatic height gauge is drifting further from the manual gauge board readings. He will continue to provide both versions at hourly intervals but will rely on the manual gauge readings for gate operations.	Correspondence	Flood Officer 1
3:05 PM	Dam Operator 7 (Wivenhoe Dam) called to report lake level of 74.81mAHD @ 15:00hrs.	Correspondence	Flood Officer 1
3:30 PM	BoM called Engineer 2 to discuss re-appraisal of the expected flood peak in Brisbane. Peak now may be 5.2 metres early on Thursday 13/12/011.	Correspondence	Flood Officer 1
4:00 PM	SDWD Model Updated - SDWD-201101121600.xls	Model Run	Flood Officer 9
4:00 PM	Dam Operator 7 (Wivenhoe Dam) called to report lake level of 74.80mAHD @16:00hrs.	Correspondence	Flood Officer 1
4:00 PM	North Pine Dam Operator called to report that Siding Creek Dam is spilling at 20.560mAHD. Spillway level is 20.37mAHD.	Correspondence	Flood Officer 1
4:20 PM	BCC called FOC and had phone conference with Duty Engineers. He was seeking update for briefing with Lord Mayor.	Correspondence	Flood Officer 1
4:52 PM	DERM called FOC and left message for Engineer 2. They (DERM) will be gauging at Jindalee all night to catch the peak. Senior Hydrographer (Seqwater) has been contacted and will be joining the crew.	Correspondence	Flood Officer 1
5:00 PM	Dam Operator 7 (Wivenhoe Dam) called to report lake level of 74.82mAHD @17:00hrs.	Correspondence	Flood Officer 1
6:00 PM	Dam Operator 7 (Wivenhoe Dam) called to report lake level of 74.80mAHD @18:00hrs.	Correspondence	Flood Officer 1
7:00 PM	Dam Operator 7 (Wivenhoe Dam) called to report lake level of 74.82 @19:00hrs.	Correspondence	Flood Officer 7
7:45 PM	Engineer 1 & Engineer 3 advised BoM that FOC will be sending updated projected releases from Wivenhoe Dam. This has been prepared with the aim of limiting flows at Moggill to 3,500 cumecs.	Correspondence	Flood Officer 7
8:00 PM	Engineer 1 & Engineer 3 advised BCC Flood Information Centre that FOC will be sending updated projected releases from Wivenhoe Dam. This has been prepared with the aim of limiting flows at Moggill to 3,500 cumecs.	Correspondence	Flood Officer 7
8:55 PM	Dam Operator 7 (Wivenhoe Dam) called to report lake level 74.82mAHD @ 21:00hrs. They will now report levels every 2 hours.	Correspondence	Engineer 1
9:15 PM	Dam Operator 7 (Wivenhoe Dam) called to inform that Energex restored power at Wivenhoe Dam at 21:15 hours.	Correspondence	Flood Officer 7

APPENDIX M – FLOOD EVENT LOG

	9:50 PM	Mt Crosby WTP Manager provided an update on Kholo & Mt Crosby: Kholo 19:15hrs 20.0m Mt Crosby 21:00 23.5m He asked for a situation update. Engineer 1 shared Wivenhoe Dam's release strategy.	Correspondence	Flood Officer 7
	10:00 PM	Dam Operator 7 (Wivenhoe Dam) called to report lake level 74.81m AHD @22:00hrs. Will now report levels every 2 hours.	Correspondence	Flood Officer 7
Thursday 13 January 2011	12:00 AM	Dam Operator 7 (Wivenhoe Dam) called to report lake level 74.79m AHD @ 00:00.	Correspondence	Flood Officer 7
	1:00 AM	BCC called FOC to enquire if Wivenhoe Dam has been compromised. Engineer 3 assured him that that is not the case.	Correspondence	Flood Officer 7
	1:05 AM	Engineer 1 called BoM hotline number to check communications.	Correspondence	Flood Officer 7
	1:10 AM	BCC called the FOC regarding a viral text rumour that Wivenhoe Dam has failed. Engineer 3 assured him that that is not true and will speak with Dam Operations Manager about this matter.	Correspondence	Flood Officer 7
	1:20 AM	Queensland Police called to inform of rumours that Wivenhoe Dam has been compromised.	Correspondence	Flood Officer 7
	1:25 AM	Engineer 3 called Dam Operator 7 (Wivenhoe Dam) to confirm Wivenhoe Dam has not been compromised.	Correspondence	Flood Officer 7
	1:30 AM	Engineer 3 called Dam Operations Manager advising him about the rumours that Wivenhoe Dam has been compromised. Engineer 3 will send him the BCC contact details.	Correspondence	Flood Officer 7
	2:00 AM	Dam Operator 7 (Wivenhoe Dam) called to report level 74.765m AHD @ 2:00hrs.	Correspondence	Flood Officer 7
	4:00 AM	Dam Operator 7 (Wivenhoe Dam) called to report lake level 74.74m AHD @4:00hrs. Will now report levels every 2 hours.	Correspondence	Flood Officer 7
	6:00 AM	Dam Operator 7 (Wivenhoe Dam) called to report lake level 74.71m AHD @6:00hrs. Will now report levels every 2 hours.	Correspondence	Flood Officer 7
	6:43 AM	BoM called to inform that BoM has lost their telephone system. He provided 2 contact numbers: 1580. Thornton St 4.45m. Telemeter 4.20m	Correspondence	Flood Officer 7
	7:30 AM	Dam Operator 2 has been advising Kilcoy Police of the FOC strategy for lower Somerset during the next 24 hours of opening sluice later today	Correspondence	Engineer 1
	7:50 AM	BOM called to ask heights 3,500m ³ /s would be at Savages and Mt Crosby. Engineer 2 advised 34.5m AHD and 16.5m AHD respectively.	Correspondence	Engineer 2
	8:05 AM	MBRC wanted to know when NPD gates will be closed. Advised to be closed by 0500 Friday	Correspondence	Engineer 2
	8:15 AM	Somerset directive #9 issued	Correspondence	Flood Officer 9
9:00 AM	Dam Operations Manager wants to know when gates setting are changed on Wivenhoe and Somerset. Advised that NPD will be closed at 05 Friday.	Correspondence	Engineer 1	

APPENDIX M – FLOOD EVENT LOG

	9:00 AM	Dam Operator 2 advised of projected level for Somerset, 103.5 by 2000 Thursday and 102.8 early Friday morning. Will open another sluice this afternoon.	Correspondence	Engineer 2.
	10:10 AM	Dam Operations Manager called to inform that power and IT services have been restored at Seqwater.	Correspondence	Flood Officer 9
	10:30 AM	Dam Operations Manager called to request if he could be notified of any changes to releases from Wivenhoe	Correspondence	Flood Officer 9
	11:00 AM	SDWD Model Updated - SDWD-201101131100.xls	Model Run	Flood Officer 9
	1:00 PM	SRC rang to enquire about Kilcoy Creek and Mary Smokes Bridge. Duty Engineers advised that it may be out of water tonight, certainly by tomorrow morning.	Correspondence	Flood Officer 9
	1:15 PM	Dam Operations Manager called to advise that Police had called to ask when Kilcoy would be accessible. Engineer 4 advised Dam Operations Manager that it would be by 6am tomorrow morning (14/1).	Correspondence	Flood Officer 9
	1:40 PM	Mt Crosby WTP Manager called for update on Mt Crosby. Engineer 2 informed him that level would be maintained at 17.5 metres for next 7 days.	Correspondence	Flood Officer 9
	2:15 PM	Phone call from MBRC. Advice as follows: * damage to Gympie Rd abutments * No evacuations * No suburban flooding * Not aware of any over floor flooding. Pine Shire had 0.75m freeboard.	Correspondence	Flood Officer 9
	2:30 PM	Wivenhoe directive #36 issued • Open Gate 1 from 3.5 metres to 4.0 metres at 1500 • Open Gate 5 from 3.5 metres to 4.0 metres at 1600 • Open Gate 1 from 4.0 metres to 4.5 metres at 1700 • Open Gate 5 from 4.0 metres to 4.5 metres at 1800.	Correspondence	Flood Officer 9
	3:50 PM	NPD Operator called to confirm if FOC received Dam Observation report for North Pine Dam. Approx 6 of 40 uplift pressure gauges has abnormal readings.	Correspondence	Flood Officer 9
	4:45 PM	MBRC was advised that NPD gates will be closed at 0500 Friday	Correspondence	Engineer 2
	7:37 PM	SunWater called to confirm building services were working and all in order.	Correspondence	Flood Officer 4
	7:51 PM	Engineer 1 called North Pine Dam Operator to discuss the current drainage strategy to close all gates by 5am tomorrow. Water level in North Pine Dam will be frequently monitored against the predictive model results, and gate opening will be adjusted accordingly if required.	Correspondence	Flood Officer 4
	8:30 PM	Engineer 1 called Dam Operator 4 to advise of directive #11.	Correspondence	Flood Officer 4
	8:41 PM	Engineer 1 called Dam Operations Manager to advise of current release rates from Wivenhoe, Somerset and North Pine Dams	Correspondence	Flood Officer 4
Friday 14 January	12:46 AM	Ipswich District (Fernvale) Police rang to enquire into the integrity of Somerset Dam, based on information received by the Police. Engineer 1 indicated that surveillance procedures are in place to monitor the integrity of the Dam, and that Engineer 1 will confirm with the operators.	Correspondence	Flood Officer 4

APPENDIX M – FLOOD EVENT LOG

2011	12:47 AM	Engineer 1 called Dam Operator 1 at Somerset to enquire to the integrity of Somerset Dam. Operator indicated all was good and no anomalies have been detected.	Correspondence	Flood Officer 4
	12:49 AM	Engineer 1 called Ipswich District Police back on 3817 1436 to confirm that Somerset was recently inspected and all was ok.	Correspondence	Flood Officer 4
	5:13 AM	Fax received from North Pine Dam confirming closure of all gates.	Correspondence	Flood Officer 4
	5:15 AM	Engineer 1 called MBRC to advise that North Pine Dam has closed the final gate at 5am.	Correspondence	Flood Officer 4
	5:16 AM	North Pine Dam Operator called to confirm that all gates are closed, and Young's Crossing should be passable within 2 hours. Lake Kurwongbah level is 20.43 m.	Correspondence	Flood Officer 4
	5:28 AM	Dam Operations Manager called to obtain a situation report. Engineer 1 provided the key information.	Correspondence	Flood Officer 4
	5:37 AM	BCC called requesting information for Wivenhoe Dam and checking sit-rep data. Enquired about flows throughout the event, Engineer 2 advised that not currently in a position to discuss these.	Correspondence	Flood Officer 4
	7:40 AM	Dam Operations Manager rang FOC to enquire about river levels at Lowood. Pumps required to be installed to supply Lowood WTP. Engineer 2 advised RD that no significant rises were expected in the Brisbane River levels in the foreseeable future.	Correspondence	Flood Officer 1
	7:45 AM	ICC phoned the FOC. Enquiring about renewed rises in the Brisbane / Bremer River systems. He cannot contact BOM for an update. Engineer 2 advised that no significant rises were expected at Moggill. A constant flow in the river was the plan as a consequence of Wivenhoe releases.	Correspondence	Flood Officer 1
	8:20 AM	Principal Dams and Weirs Planning phoned Engineer 2. Enquiry regarding the Wivenhoe Dam fuse plugs (design calcs/parameters).	Correspondence	Flood Officer 1
	8:21 AM	Seqwater CEO phoned the FOC. Engineer 2 discussed with CEO the release strategy from Wivenhoe Dam with a view to opening the Fernvale Bridge and Mt Crosby Bridge at the earliest possible time. Engineer 2 also updated CEO on the projected City Gauge height over the next few days. This being ~2.5 metres due to continuous releases from Wivenhoe Dam.	Correspondence	Flood Officer 1
	8:30 AM	Engineer 2 returned call back to Principal Dams and Weirs Planning. Engineer 2 extended an invitation to him and others to pay a visit to the FOC to inspect operations.	Correspondence	Flood Officer 1
	10:10 AM	Dam Operator 2 rang from Somerset Dam. Checking that all comms avenues (faxes & e-mails) are functioning. All good.	Correspondence	Flood Officer 1
	10:25 AM	BCC rang TM. Enquiring if any chance of cutting back Wivenhoe releases to lower flows than the current figure of 3,500 cumecs. Engineer 2 response was NO!	Correspondence	Flood Officer 1
	10:40 AM	SunWater transmitted a message to Principal Dams and Weirs Planning that the right bank abutment to Mt Crosby Bridge has suffered some erosion due to the flooding and there are concerns that the abutment may be further affected by piping once the water level falls.	Correspondence	Flood Officer 1

APPENDIX M – FLOOD EVENT LOG

	10:50 AM	Operations Coordinator North rang from North Pine. The dam ceased flood operations at 5:00am this morning and fish recovery and clean-up has been completed. Approx. 31 lung fish were rescued. Quite a number of dead lung fish and other species. Erosion damage downstream of the dam is severe with loss of vegetation, stripped and fallen trees, bank erosion, and many dead fish caught within the root ball of fallen trees. He is organising back hoes and front end loader machinery to clear the debris between the NP dam wall and Grant Street.	Correspondence	Flood Officer 1
	12:33 PM	Flood Officer 7 phoned Engineer 2. Request from Seqwater Corp Comms about hourly updates. Particular concern about NPD which ceased flood operations at 5:00am this morning!! Engineer 3 advised that updates from the dams would continue to be channeled solely through the FOC.	Correspondence	Flood Officer 1
	12:35 PM	DERM phoned Engineer 2. Re: Gauging exercise at Jindalee:- Soundtek M9 from boat (6 passes) Jindalee gauging result:- 4,300m ³ /sec at 6:45 metres AHD at 12:00 hrs	Correspondence	Flood Officer 1
	12:37 PM	Seqwater CEP rang Engineer 2. Discussion about mis-informed reporting.	Correspondence	Flood Officer 1
	1:45 PM	Engineer 2 rang BCC seeking clarification on BCC's flood mapping. BCC advised that at 3,500 cumecs, BCC records indicate that 220 properties will have water on the property. Engineer 2 confirmed that 'water on the property' did not mean water above floor level i.e. Likely to be land inundation only.	Correspondence	Flood Officer 1
	1:53 PM	Dam Operations Manager rang Engineer 2. Routine call. Update on current status.	Correspondence	Flood Officer 1
	2:45 PM	Dam Operations Manager rang Engineer 2. Routine call. Update on current status.	Correspondence	Flood Officer 1
	3:30 PM	Dam Operator 10 rang from Wivenhoe Dam with concerns about some 'swirling' apparent in the downstream tailwater opposite 'The Common'. Dam Operator 10 thought there could be some erosion occurring under the flow. Matthew forwarded a marked photo of the phenomenon to Engineer 2. The consensus reached was that the phenomenon was the result of a 'hydraulic jump'. The matter would be referred to Engineer 4 for further investigation.	Correspondence	Flood Officer 1
	3:55 PM	Engineer 2 rang Engineer 4 to discuss the 'swirling' phenomenon identified by Dam Operator 10. Effect is at D/S end of plunge pool and is almost certainly a 'hydraulic jump'. Engineer 4 advised the issue was not of concern unless the phenomenon moves toward the flip bucket.	Correspondence	Flood Officer 1
	4:05 PM	Engineer 4 phoned Dam Operator 10 at Wivenhoe Dam to pass on advice that Engineer 4 had no concerns about the 'hydraulic jump' phenomenon identified by him earlier today.	Correspondence	Flood Officer 1
	4:50 PM	Mt Crosby WTP Manager phoned the FOC. Engineer 2 advised him that the current release strategy from Wivenhoe Dam (and therefore flows past the Mount Crosby WTPs) would be maintained until at least Monday (17/1).	Correspondence	Flood Officer 1
	5:50 PM	Dam Operations Manager rang Engineer 4 enquiring when the bridges to the east of Lake Wivenhoe would be clear of floodwater. Engineer 4 advised all but the Sandy Ck - A&PM Conroy Bridge on the Wivenhoe Somerset Rd would be clear by tomorrow (Sat) morning.	Correspondence	Flood Officer 1
	7:00 PM	FOC change over.	Other	Flood Officer 2
Saturday 15	8:40 AM	Dam Operations Manager rang. Engineer 2 advised strategy to possibly go below FSL at Wivenhoe by Thursday.	Correspondence	Flood Officer 3

APPENDIX M – FLOOD EVENT LOG

January 2011	8:42 AM	Seqwater CEO rang to advise that the media come into the FOC today to take photos.	Correspondence	Flood Officer 3	
	11:30 AM	Dam Operations Manager rang to request a summary of the Operations Manual for Wivenhoe. Engineer 1 to provide after checking with all duty engineers.	Correspondence	Flood Officer 3	
	12:12 PM	Dam Operations Manager rang to advise of a phone hook-up with the Minister and Seqwater CEO at 2:00pm, and requested that Engineer 1 be in at the FCO at that time.	Correspondence	Flood Officer 3	
	12:20 PM	Seqwater CEO rang to confirm a phone hook-up with the Minister and CEO at 2:00pm.	Correspondence	Flood Officer 3	
	12:55 PM	Engineer 2 advised Engineer 1 to come into the FOC for the phone hook-up at 2:00pm.	Correspondence	Flood Officer 3	
	1:10 PM	Director Dam Safety phoned about the Wivenhoe Flood manual summary. Engineer 2 told Director Dam Safety that the summary is with the other duty engineers for checking before issuing.	Correspondence	Flood Officer 3	
	1:15 PM	Dam Operations Manager rang with some questions on the Wivenhoe Flood manual summary.	Correspondence	Flood Officer 3	
	1:45 PM	Engineer 1 and Engineer 4 arrived at the FOC for the 2:00pm phone hook-up.	Correspondence	Flood Officer 3	
	2:00 PM	Phone hook-up with Engineer 2, Engineer 1, Engineer 4 with Dam Operations Manager, Director Dam Safety, Seqwater CEO, Joh Bradley and Bob Reilly to discuss a report for the minister by COB Sunday.	Correspondence	Flood Officer 3	
	5:00 PM	Dam Operations Manager arrived to help write report for minister briefing.	Correspondence	Flood Officer 3	
	7:30 PM	Dam Operator 7 from Wivenhoe called to discuss strategy for the next 12 hours.	Correspondence	Flood Officer 4	
	<u>Sunday 15 January 2011</u>	4:12 AM	Called Dam Operator 7 at Wivenhoe to confirm directive received via email. Directive being actioned ASAP.	Correspondence	Flood Officer 4
		7:10 AM	Dam Operator 2 (Somerset Dam) emailed flood centre indicating he believed flood centre phones were out. Tried to contact Ag by office and mobile phones with no success (Telstra message bank on office phone and Dam Operator 2's message on mobile). Flood centre phones were checked - working OK. Problem is with Somerset phones. Believe fax also not receiving. Dam Operator 2 emailed to confirm they have local calls but no STD. Continued checking mobile - no response.	Correspondence	Flood Officer 6
8:20 AM		Called Dam Operator 10 at Wivenhoe to confirm directive 45 received. Confirmed not received - busy status on fax confirmation. Confirmed directive received via email.	Correspondence	Flood Officer 6	
9:40 AM		Retried all phones at Somerset - no response. Dam Operator 2 emailed to confirm that all phones are down at Wivenhoe. Email is still working and he will be checking emails every hour on the hour.	Correspondence	Flood Officer 6	
10:20 AM		Email confirmation received that Somerset Directive #12 implementation has been completed.	Correspondence	Flood Officer 6	
11:30 AM		FOC contacted by Ipswich/Somerset District Disaster Coordinator notifying that the Wivenhoe viewing area has been damaged. Engineer 1 unable to contact Wivenhoe staff (Dam Operator 10) - message left. Then contacted Dam Operator 7, who confirmed that the area is damaged and has been locked off and 2 security guards are on site. It won't be opened until the water level falls and a full inspection of the structure has been completed. Engineer 1 confirmed this with Police, who reported that there was damage to safety rails and water supply to toilets. Dam Operator 10 also responded to Engineer 1's call and confirmed the details.	Correspondence	Flood Officer 6

Deleted: A

APPENDIX M – FLOOD EVENT LOG

	12:30 PM	Phone call from Dam Operator 10 (Wivenhoe) - neither fax nor email received. Verbal instruction given to implement gate operation as per Directive #46 and email resent.	Correspondence	Flood Officer 6
	12:40 PM	Contract programmer called to advise that the back-up Linux box "Namah" at Mineral House is showing file system corruption errors, so the FCC is effectively without backup. The hydraulic model in the RTFN is missing because two Fortran programs "Modcom 2" and "Model" have not been ported to the Linux box.	Correspondence	Flood Officer 6
	12:55 PM	Engineer 1 advised Warren Shallcross about the situation at Mineral House, and he will visit the backup operations centre ASAP.	Correspondence	Flood Officer 6
	1:10 PM	Dam Operator 2 (Somerset) called to report that the phones are now working.	Correspondence	Flood Officer 6
	2:40 PM	Engineer 2 spoke to Engineer 1. Grid manager wants a summary of flood volumes and peak discharges.	Correspondence	Flood Officer 6
	3:00 PM	Warren Shallcross called - confirmed with Engineer 1 that the computer system at Mineral House has been rebooted and is functional.	Correspondence	Flood Officer 6
	3:10 PM	Dam Operations Manager rang to confirm current discharges. Confirmed 600 cumecs for Somerset and 3500 cumecs for Wivenhoe (approx).	Correspondence	Flood Officer 6
	4:00 PM	Directive #47 implemented - Gate 2 opened to 7.0 m.	Correspondence	Flood Officer 6
	6:52 PM	Engineer 1 spoke with Dam Operator 7 (Wivenhoe Dam) about Directive #48 Wivenhoe strategy. Dam Operator 7 confirmed receipt of Directive.	Correspondence	Flood Officer 7
	7:00 PM	FOC change over.	Other	Flood Officer 7
	10:00 PM	Dam Operator 7 (Wivenhoe Dam) called to inform floor panels missing from bulks.	Correspondence	Flood Officer 7
Monday 17 January 2011	7:15 AM	Dam Operations Manager called to get Sit Rep. Advised that Somerset should remain mobilised until further notice	Correspondence	Flood Officer 8
	7:35 AM	Dam Operator 2 called - discussed strategy i.e. operate cone valves only from now on	Correspondence	Flood Officer 8
	9:15 AM	Mt Crosby WTP Manager called to find out about strategy for Wivenhoe shut down. Informed him that we will start closing down mid afternoon and aiming to have it closed by Wednesday	Correspondence	Flood Officer 8
	9:35 AM	Dam Operations Manager called to enquire when closing down will start and reminded us to inform Councils	Correspondence	Flood Officer 8
	10:00 AM	Advise Director Dam Safety about inconsistency between readings from BoM and actual HW gauges	Correspondence	Flood Officer 8
	10:15 AM	SRC was contacted and advised gate close will commence this afternoon and Fernvale Bridge will be out of the water sometime Tuesday morning	Correspondence	Flood Officer 8
	10:20 PM	BCC was contacted (left message) advising gate close will commence this afternoon.	Correspondence	Flood Officer 8
	10:20 PM	ICC was contacted (left message) advising gate close will commence this afternoon.	Correspondence	Flood Officer 8
	11:15 PM	Called Mt Crosby WTP Manager to inform him that flow in Lockyer is 75m ³ /s and falling.	Correspondence	Flood Officer 8
	11:15 PM	Spoke to BCC. Advised him about gate closure. He mentioned that BCC will not provide any info on flood recurrence until they discussed with FOC.	Correspondence	Flood Officer 8

APPENDIX M – FLOOD EVENT LOG

	11:20 AM	Dam Operations Manager called - Council wants to know draw down rates, so they can determine the effects on Coronation Dr. Engineer 3 informed RD that BCC did not raise this when they spoke 10 mins before.	Correspondence	Flood Officer 8
	11:20 AM	Seqwater CEO called saying he will email a revised copy of Michael O'Brain's document	Correspondence	Flood Officer 8
	12:20 PM	Engineer 3 contacted BCC to get an update on Coro Dr situation. Engineer 3 spoke to BCC. BCC advised he had spoken to BCC Geotec Officers and they had advised that @ this stage as Coro Dr was back within the banks that they could not see an immediate problem. Some bank slumping have been identified further up the river. Council would like the recession of flow to be as flat as practicable but also that releases be as small as possible @ the Port Office gauge by the time of the high tide on Friday. This is consistent with our current strategy of closing releases by Wednesday 20 Jan 2010.	Correspondence	Flood Officer 8
	12:30 PM	Dam Operations Manager called, requesting an update on discussions with BCC. He requested that BCC confirm the discussion of 12:20 in writing.	Correspondence	Flood Officer 8
	1:01 PM	Dam Operations Manager called, saying Morton Bay wanted to know if there will be any more releases from NPD. Engineer 3 said nil planned unless we get more rain.	Correspondence	Flood Officer 8
	2:15 PM	Dam Operations Manager called, asking for dates and times for Wivenhoe operations at the peak of the flood.	Correspondence	Flood Officer 8
	3:15 PM	BoM called to confirm that he received the info on the discrepancy in the auto level recorder	Correspondence	Flood Officer 8
	4:15 PM	BoM - they have not received manual observations for days	Correspondence	Flood Officer 8
Tuesday 18 January 2011	12:30 AM	Seqwater CEO called to inform that rapidly dropping water level at Lowood was causing issues with pumping for WTP. Asked if FOC could call John Granzien and then notify him via txt of the outcome.	Correspondence	Flood Officer 9
	12:35 AM	FOC contacted John Granzien in regards to pumping issues at Lowood. Engineer 3 decided to halt all gate operations until further notice in order to ensure security of water supply to Lowood.	Correspondence	Flood Officer 9
	1:00 AM	Text message sent to Seqwater CEO to advise of cessation of Wivenhoe gate operations until further notice.	Correspondence	Flood Officer 9
	2:00 AM	BCC advise that the recession at Coronation Drive is not an issue with regards to bank stability	Correspondence	Flood Officer 9
	5:00 AM	Dam Operator 7 called to advise that Fernvale Bridge was emerging from river. Current release 2054 cumecs.	Correspondence	Flood Officer 9
	5:40 AM	Dam Operator 7 called to advise that the approach to the Fernvale Bridge from the Fernvale side was still underwater due to water backed up in the quarry.	Correspondence	Flood Officer 9
	5:45 AM	Called John Granzien to advise that Wivenhoe gate operations would recommence close down sequence from 9am as per original strategy. John to advise FOC if pumping operation at Lowood would benefit from additional 3 - 6 hours delay in gate operations.	Correspondence	Flood Officer 9
	7:25 AM	Dam Operator 7 (Wivenhoe) called to advise that a Surveyor is taking a routine deformation survey	Correspondence	Flood Officer 5
	7:35 AM	BCC enquired about preliminary assessment of magnitude of flood. BCC suggested that Seqwater, BOM and BCC should arrive at a consensus regarding any assessment on the magnitude of the event. Engineer 1 agreed. BCC also enquired if we had done an assessment of the effects of the dam on peak flow. Engineer 1 indicated that our prelim figure was a 13000 cumec peak at City Gauge without the Dams.	Correspondence	Flood Officer 5

APPENDIX M – FLOOD EVENT LOG

8:25 AM	Dam Operator 10 (Wivenhoe) called to acknowledge Directive 55	Correspondence	Flood Officer 5
10:10 AM	Seqwater at Mt Crosby has requested some forward projections for flows at Mt Crosby Weir for the next 48 hours. They are looking at sludge dilution.	Correspondence	Flood Officer 5
10:15 AM	Engineer 1 called Rob Townsley back to provide the following info re projected flows at Mt Crosby Weir: 18/1/2011 10:00 - 2300 cumecs 19/1/2011 10:00 - 1130 cumecs 20/1/2011 10:00 - 360 cumecs	Correspondence	Flood Officer 5
10:19 AM	BCC Flood Information Centre called to advise that Campbell Newman wants an indication of what the flood would have been without dams and asked if the figure of 13000 cumecs provided to BCC earlier could be released to the public.	Correspondence	Flood Officer 5
10:24 AM	Engineer 1 spoke to Dam Operations Manager to ask Seqwater's policy re release of information above. Dam Operations Manager to confirm with his comms people.	Correspondence	Flood Officer 5
10:30 AM	Seqwater comms officer called to advise that the minister's office has recommended that no info regarding releases from WD be released to anybody. He will now communicate this response to the BCC Flood Info Centre and specifically Mark Gibson.	Correspondence	Flood Officer 5
10:38 AM	Somerset RC requested info re when Burtons Bridge is expected to be free from inundation. Under our current shutdown sequence, Engineer 1 advised that we expect Burtons to be free around midnight on Wed evening. SRC also advised that the bridge on New England Creek will become flood free at around the same time. SRC indicated that at 8am today the approaches to Fernvale were clear of water. However, power lines and silt need to be removed. He expects the bridge to be open this afternoon.	Correspondence	Flood Officer 5
10:55 AM	Principal Dams and Weirs Planning (Seqwater) called to confirm that we received the hydraulic model from WRM. (affirmative)	Correspondence	Flood Officer 5
12:05 PM	Seqwater CEP called to advise that he and DERM will come and visit the FOC at 2:30 this afternoon.	Correspondence	Flood Officer 5
12:26 PM	Dam Operations Manager called to confirm programmed final shutdown. Engineer 1 advised scheduled for 9am Thursday 20/1 2011. Dam Operations Manager to confirm fish recovery.	Correspondence	Flood Officer 5
1:22 PM	Confirmed with Dam Operator 40 that gate closure sequence was in accordance with directive as email received from WD re 13:00 closure was incorrect.	Correspondence	Flood Officer 5
2:00 PM	Engineer 4 called for an update of the closedown sequence	Correspondence	Flood Officer 5
2:15 AM	Engineer 1 called WRM re hydraulic model of Brisbane River...login and password not working...help not available at present	Correspondence	Flood Officer 5
2:30 PM	Seqwater CEO and DERM visited FOC to check current situation and to pass on thanks for job performed so far. Also requested that we hold further gate operations until problems at Lowood Pump Station are resolved.	Other	Flood Officer 5
4:05 PM	Engineer 1 called NPD Operator to alert him to the possibility of operating North Pine Dam with incoming storms.	Correspondence	Flood Officer 5

APPENDIX M – FLOOD EVENT LOG

4:30 PM	Dam Operations Manager rang noting the current storms and requested that Engineer 1 call MBRC to advise of the possibility of operating North Pine Dam.	Correspondence	Flood Officer 5
4:34 PM	Email from Seqwater CEO containing Bob Reilly's approval to vary the flood release regime to enable a constant flow for the Lowood WTP offtake.	Correspondence	Flood Officer 5
4:45 PM	Engineer 1 rang MBRC to advise of the possibility of operating North Pine Dam in the next day or so if predicted falls of up to 50mm occurred.	Correspondence	Flood Officer 5
6:25 PM	Dam Operations Manager called to discuss situation report for North Pine.	Correspondence	Flood Officer 5
6:57 PM	Engineer 4 phoned MBRC. Message left regarding plans to open NPD gates this evening as the lake level is approaching trigger level with more rain / showers forecast.	Correspondence	Flood Officer 1
7:02 PM	Engineer 4 phoned NPD Operator regarding mobilising for NPD gate opening this evening. Tentative plan is for commencement of gate opening at 20:30.	Correspondence	Flood Officer 1
7:05 PM	Engineer 4 phoned the Duty Officer at MBRC regarding the planned imminent opening of the NPD gates. Target time is 20:30 if Council has the barriers in place-closing Youngs Crossing Road and the dam is fully manned.	Correspondence	Flood Officer 1
7:05 PM	Flood Officer 1 phoned Dam Operations Manager to provide an update on the NPD mobilisation and proposed gate openings.	Correspondence	Flood Officer 1
7:07 PM	Engineer 4 phoned Operations Coordinator North to advise of planned gate opening of NPD this evening. Cessation of operations (i.e. gate closure) is expected to be arranged for tomorrow morning (19/1) in order for Youngs Crossing Road to be opened to peak hour traffic. Engineer 4 advised MD to plan for an early morning fish recovery exercise at NPD.	Correspondence	Flood Officer 1
7:10 PM	MBRC returned phone call to Engineer 4. Engineer 4 repeated information already conveyed to MBRC Duty Officer - regarding requirement for Youngs Crossing Road to be closed to traffic to allow NPD gates to be operated by 20:30 if possible.	Correspondence	Flood Officer 1
7:15 PM	Engineer 4 phoned Seqwater regarding Engineer 4 inability to access Citrix. Outage (?). Message left.	Correspondence	Flood Officer 1
7:15 PM	Engineer 4 phoned Dam Operations Manager regarding Citrix comms outage. Message left requesting Dam Operations Manager to intervene to have the problem fixed.	Correspondence	Flood Officer 1
7:20 PM	IT (Seqwater) rang and 'reset' Citrix for Engineer 4.	Correspondence	Flood Officer 1
7:30 PM	Engineer 4 phoned NPD Operator to confirm gate opening arrangements for 20:30 if Youngs Crossing Road has been closed to traffic by Council at that time.	Correspondence	Flood Officer 1
7:40 PM	Dam Operations Manager rang the FOC to enquire if the Citrix issue was sorted. Citrix connection now functioning. Engineer 4 expressed concern about the current release strategy for Wivenhoe Dam. If the current release rate is maintained (set to accommodate Lowood temporary raw water pumps), the model indicates that the lake level could fall well below FSL (~ EL 65.00??).	Correspondence	Flood Officer 1

APPENDIX M – FLOOD EVENT LOG

7:42 PM	Engineer 4 phoned Executive GM Water Delivery (Seqwater) to seek advice on who could supply the most up-to-date status report on the current situation at Lowood regarding river levels and pumping activities to supply the WTP. He suggested John Smith (?).	Correspondence	Flood Officer 1
7:45 PM	Engineer 4 phoned Principal Strategic Asset Maintenance Engineer (Seqwater) seeking info Re: Lowood. Maintenance Engineer referred Engineer 4 to Strategic Asset Maintenance Engineer (Civil).	Correspondence	Flood Officer 1
7:50 PM	Engineer 4 phoned Maintenance Engineer (Civil). - Reportedly on site at Lowood PS. No answer. Message left.	Correspondence	Flood Officer 1
7:52 PM	Engineer 4 phoned Lowood WTP Operator to enquire as to current status regarding temporary pumping arrangements of raw water from the Brisbane River.	Correspondence	Flood Officer 1
7:55 PM	Dam Operator 2 (Somerset Dam operator) phoned the FOC from home seeking the Duty Engineer's intentions for operations at Somerset Dam overnight. Engineer 4 requested a Gauge Board reading of the lake level and advised that an operations strategy for Somerset Dam would be addressed within 30 minutes - following satisfactory mobilisation of NPD.	Correspondence	Flood Officer 1
8:00 PM	Seqwater IT phoned Engineer 4 to check status of Citrix connection. Citrix connection is functioning.	Correspondence	Flood Officer 1
8:05 PM	Dam Operator 2 phoned from Somerset Dam. Current lake level is EL 98.95 unchanged from lake level at 15:35 today.	Correspondence	Flood Officer 1
8:05 PM	Engineer 4 phoned Dam Operator 9 at home. Engineer 4 requested Dam Operator 9 to visit Lowood pumping intake site and report on status as unable to contact Maintenance Engineer (Civil).	Correspondence	Flood Officer 1
8:11 PM	Engineer 4 phoned Dam Operator 2 (Somerset). Dam Operator 2 to send fax in with lake level. Likely strategy will be to close off the regulator overnight and re-assess the situation in the morning.	Correspondence	Flood Officer 1
8:12 PM	Engineer 4 conversed with Manager Strategic Maintenance (Seqwater). He advised that arrangements are in hand to move the temporary pumps at the Brisbane River site at Lowood. The pumps are being re-located downhill to maintain extraction of raw water from the river to supply the Lowood WTP.	Correspondence	Flood Officer 1
8:15 PM	Maintenance Engineer (Civil) contacted Engineer 4. The temporary raw water pumps at Lowood are being moved closer to the river - chasing the anticipated lower level in the river due to reduced releases from Wivenhoe.	Correspondence	Flood Officer 1
8:18 PM	Dam Operations Manager rang the FOC to seek an update on operations at all 3 storages.	Correspondence	Flood Officer 1
8:25 PM	Engineer 4 confirmed on-site manning arrangements at Lowood with Dam Operator 9.	Correspondence	Flood Officer 1
8:30 PM	Somerset Dam Operator advised FOC by fax that Regulator #12 had been closed as per verbal advice from Engineer 4.	Information	Flood Officer 1
8:35 PM	Engineer 4 contacted Dam Operator 7 at Wivenhoe. Gate closing directive pending.	Correspondence	Flood Officer 1
8:55 PM	NPD Operator phoned the FOC. MBRC have only just closed off Youngs Crossing Road. By the time the siren is sounded, the gate openings in Directive 31 scheduled to commence at 20:30 will be delayed by 45 minutes.	Correspondence	Flood Officer 1
9:00 PM	Duty Officer at MBRC rang Engineer 4 to advise that Youngs Crossing Road was now closed. Engineer 4 advised Duty Officer that it was intended to maintain releases from NPD through until 5:00am Wednesday 19/1. With this operating strategy, Young's Crossing Road should be able to be re-opened to traffic by 7:00am tomorrow.	Correspondence	Flood Officer 1

APPENDIX M – FLOOD EVENT LOG

	9:05 PM	Note: Wivenhoe Dam fax machine is still inoperative	Correspondence	Flood Officer 1
	9:08 PM	Engineer 4 phoned Operations Coordinator North to advise of planned gate opening of NPD this evening	Correspondence	Flood Officer 1
	9:15 PM	Dam Operations Manager phoned Engineer 4 to discuss the Wivenhoe release strategy and its potential to effect bank slumping at Coronation Drive. The changed situation at Lowood means that the reduction in Brisbane River levels will now be far more even. Dam Operations Manager advised that Coronation Drive is no longer a concern.	Correspondence	Flood Officer 1
	9:30 PM	Flood Officer 1 phoned BCC and made contact with BCC's Flood Operations (Disaster Management) Centre. Engineer 4 requested confirmation that Coronation Drive would not be adversely affected by way of bank slumping if releases from Wivenhoe were terminated on Wednesday afternoon. Engineer 4 requested BCC to investigate and call back the FOC.	Correspondence	Flood Officer 1
	9:38 PM	Flood Officer 1 contacted Dam Operator 7 at Wivenhoe Dam by 2-way radio to confirm his receipt of e-mail containing Directive #59. Dam Operator 7 also confirmed that the Wivenhoe fax machine is still inoperative. All written comms to be by e-mail.	Correspondence	Flood Officer 1
	9:50 PM	Engineer 4 phoned Dam Operations Manager. Wivenhoe release strategy discussed regarding Lowood WTP temporary offtake level, concerns about Coronation Drive bank slumping and lake level at cessation of releases if targeted for tomorrow afternoon.	Correspondence	Flood Officer 1
	9:53 PM	BCC's Flood Operations (Disaster Management) Centre phoned Engineer 4. Wivenhoe release strategy and effect on Coronation Drive discussed. BCC have no concerns about imminent cessation of Wivenhoe releases. Engineer 4 explained that it was more likely that the tidal variation at Toowong would have a greater impact on the river banks than the Wivenhoe releases.	Correspondence	Flood Officer 1
	10:00 PM	Engineer 4 phoned NPD Operator to discuss release strategy i.e. planned gate openings to setting #2 followed by closure sequence to be completed by early tomorrow morning (19/1).	Correspondence	Flood Officer 1
	10:02 PM	Dam Operations Manager phoned Engineer 4. Release strategy and final lake level at gate closure at Wivenhoe discussed.	Correspondence	Flood Officer 1
	10:14 PM	Dam Operator 9 phoned Engineer 4. Situation at Lowood is under control. Engineer 4 advised Dam Operator 9 that the releases at Wivenhoe are planned to cease by early afternoon tomorrow (19/1).	Correspondence	Flood Officer 1
Wednesday 19 January 2011	3:30 AM	Engineer 4 phoned the Mount Crosby WTP to obtain an update on the status of the Mount Crosby Weir Bridge. It is currently clear of water and came out of inundation approx 14:00 yesterday (18/1). The bridge has reportedly suffered some damage. Details unknown.	Correspondence	Flood Officer 1
	4:38 AM	Engineer 4 advised Dam Operator 7 at Wivenhoe Dam that the strategy for further gate closures after 0500 was dependant on the outcome of a discussion with Seqwater CEO anticipated within the hour. Dam Operator 7 advised that the Fernvale Bridge was clear of floodwater but that it had power lines down on /around it.	Correspondence	Flood Officer 1
	5:05 AM	Dam Operator 7 from Wivenhoe Dam phoned the FOC to report that some erosion has occurred in the vicinity of the plunge pool downstream of the flip bucket. This has become evident now that the gate releases have been reduced. Some large boulders (~ 10t) are evident piled up against the bench D/S of the flip bucket. Engineer 4 will need to inspect the damage ASAP.	Correspondence	Flood Officer 1

APPENDIX M – FLOOD EVENT LOG

5:10 AM	Engineer 4 phoned Seqwater CEO to obtain a Govt. view on how long to maintain releases and to where the lake level should be held following closure of all gates. Timing of the gate closure might be dependant on the erosion issue.	Correspondence	Flood Officer 1
5:15 AM	Engineer 4 phoned Engineer 2 to arrange for Engineer 2 to relieve Engineer 4 ASAP in the FOC as he is required to inspect the reported damage at Wivenhoe Dam.	Correspondence	Flood Officer 1
5:20 AM	Engineer 4 phoned Principal Dams and Weirs Planning (Seqwater) to arrange a joint inspection of the erosion damage at Wivenhoe Dam as reported by Dam Operator 7.	Correspondence	Flood Officer 1
5:25 AM	Dam Operations Manager phoned Engineer 4 to obtain an update. Engineer 4 advised Dam Operations Manager that damage has been reported to the area D/S of the flip bucket at Wivenhoe. An inspection ASAP is warranted.	Correspondence	Flood Officer 1
5:30 AM	Engineer 4 phoned Director Dam Safety to advise that damage had been reported at Wivenhoe Dam by the operator. Initial information indicates that large boulders are piled up in the plunge pool D/S of the flip bucket. The source of these boulders is unknown as releases are still continuing from the gates. Engineer 4 has arranged to inspect the site with Principal Dams and Weirs Planning in a few hours and an invitation was extended to Director Dam Safety as an interested party to attend the inspection. Engineer 4 will provide updates as they come to hand.	Correspondence	Flood Officer 1
5:35 AM	Dam Operator 7 phoned Engineer 4 on his mobile phone with an update report.	Correspondence	Flood Officer 1
8:08 AM	Engineer 4 phoned Engineer 2. Things seem to be O.K. but we will continue to close all gates by this afternoon.	Correspondence	Flood Officer 2
8:20 AM	Engineer 2 phoned Flood Warning Centre advising that flood operation for current event will be shut down around lunch time.	Correspondence	Flood Officer 2
9:23 AM	Engineer 4 phoned Engineer 2 asking whether we should run a regulator.	Correspondence	Flood Officer 2
9:51 AM	Engineer 2 phoned Engineer 4 regarding modelling results.	Correspondence	Flood Officer 2
10:00 AM	Engineer 2 phoned Engineer 4 regarding modelling results. Engineer 2 wants to advise Dam Operator 7 to stop at Gate 3 at 1 metre, but they agree to close as planned and maintain operational release instead of flood release.	Correspondence	Flood Officer 2
10:15 AM	Engineer 4 has discussed the event closure with Director Dam Safety. It was agreed that the flood will be considered closed with the closure of the gates at 1200. At that time, control of the dam will revert to Seqwater. As the low flow channel to the regulator is blocked, the centre gate will be opened to 1 metre to manage on-going inflows with the aim of getting to 95% (EL 66.5).	Correspondence	Engineer 2
10:43 AM	Received QPF - 15mm generally, heavier falls to about 50mm in Brisbane and North Pine catchments.	Other	Flood Officer 2
11:14 AM	Engineer 3 phoned Engineer 2 - Still operational until tonight.	Correspondence	Flood Officer 2
11:28 AM	Seqwater at Mt Crosby phoned FOC requesting for peak flow at Mt Crosby Weir during the latest event.	Correspondence	Flood Officer 2
11:36 AM	Engineer 2 phoned Engineer 4 confirming that Engineer 3 and Flood Officer 8 will be on tonight.	Correspondence	Flood Officer 2
11:45 AM	Engineer 2 phoned Mt Crosby advising that peak flow over Mt Crosby Weir was about 9150 cumecs.	Correspondence	Flood Officer 2
11:51 AM	Engineer 2 phoned (left message with) MBRC regarding potential for closing operation tonight.	Correspondence	Flood Officer 2
11:52 AM	Engineer 2 phoned (left message with) Operations Coordinator North to call him back.	Correspondence	Flood Officer 2

APPENDIX M – FLOOD EVENT LOG

11:59 AM	Engineer 4 phoned Engineer 2 stating that divers will investigate erosion d/s Wivenhoe Dam today.	Correspondence	Flood Officer 2
1:25 PM	Mt Crosby phoned Engineer 2 discussing about the information which Engineer 2 sent.	Correspondence	Flood Officer 2
1:39 PM	Dam Operator 10 phoned Engineer 2 advising Wivenhoe Dam EL is 66.89 m AHD.	Correspondence	Flood Officer 2
3:21 PM	MBRC phoned wanting AJ Wyllie Bridge to be closed at 9:00 PM rather than 7:00 PM, and stating that she will update 24 hour call centre number. They will send email to confirm all this.	Correspondence	Flood Officer 2
4:00 PM	Received QPF - 15mm-25mm generally, heavier falls to about 50mm in Brisbane and North Pine catchments.	Other	Flood Officer 2
7:30 PM	MBRC called to say that the alternate route @ Petri is open (sooner than the 9 PM forecast)	Correspondence	Flood Officer 8
9:10 PM	Called Operations Coordinator North to inform him that NPD will be mobilised.	Correspondence	Flood Officer 8
9:10 PM	Called NPD Operator to mobilise. The WL is approaching trigger level for gate opening.	Correspondence	Flood Officer 8
9:20 PM	Called MBRC call centre to inform them that NPD will be operated. They called back and advised that they can close Young's crossing by 11 PM. They will confirm once road is closed.	Correspondence	Flood Officer 8
9:38 PM	NPD Operator called to confirm they are ready The gauge reading was 39.54 @ 9:30PM	Correspondence	Flood Officer 8
2:15 AM	MBRC called regarding release at NPD. He was advised that the gates will be open for a while yet	Correspondence	Flood Officer 8
6:50 AM	MBRC called to find out when the gates on NPD will be shut. They were advised that the gates will only be closed in time for the afternoon peak.	Correspondence	Flood Officer 8
7:20 AM	Engineer 1 called SRC to advise of flow in Lockyer Creek. Tony concerned about Burtons Bridge but Engineer 1 indicated that we will endeavour to keep flows below 400 m3/s.	Correspondence	Engineer 1
7:25 AM	Engineer 1 called Ipswich CC and advised of renewed flows in Lockyer Creek and Middle Brisbane R.	Correspondence	Engineer 1
7:40 AM	Engineer 1 called BCC and advised of increased flows in Lockyer Creek and Middle Brisbane. Advised that Savages Crossing and/will be Colleges Crossing are inundated. Estimated travel time 30 to 36 hours.	Correspondence	Engineer 1
7:55 AM	Engineer 1 called NPD and spoke to Dam Operator 7. Discussed proposed strategy to drain until around 2:00 PM with current gate settings. Requested hourly readings so as to monitor model performance.	Correspondence	Engineer 1
8:00 AM	NPD Operator called to discuss proposed operations. Engineer 1 indicated that we will continue as is until 10:00am QPF comes in and then decide from there as to strategy.	Correspondence	Engineer 1
8:40 AM	Dam Operations Manager called enquiring about the timeliness of the notice we gave to MBRC. Engineer 1 advised him accordingly.	Correspondence	Flood Officer 2
8:45 AM	Flood Officer 9 called (re Lowood pump station) enquiring the time to peak (height and discharge). FOC response was about 9 hours with height of about 3.7 m corresponding to 300 cumecs.	Correspondence	Flood Officer 2
8:50 AM	Flood Officer 9 called (re Lowood pump station) enquiring current height and discharge. Together we estimated that it was about 150 cumecs (50 from Lockyer Creek and 100 from Wivenhoe Dam) corresponding to about 2.4 m.	Correspondence	Flood Officer 2

APPENDIX M – FLOOD EVENT LOG

9:45 AM	Dam Operations Manager advised Wivenhoe will not be drained to 66.5 m AHD, but will be maintained at or just below FSL.	Correspondence	Flood Officer 2
10:21 AM	Received QPF - 15mm-25mm generally, heavier falls to about 50mm in Brisbane and North Pine catchments.	Other	Flood Officer 2
10:30 AM	Dam Operations Manager called enquiring whether closing all releases in Wivenhoe Dam will cause level to exceed gate trigger in the next three day. Engineer 1 advised that with rain on the ground he expects it not to, however forecast as per QPF is 15-25 mm, so we may need to review that decision tomorrow.	Correspondence	Flood Officer 2
11:12 AM	MBRC called. Engineer 1 advised all gates will be closed at 2:00 PM.	Correspondence	Flood Officer 2
11:14 AM	Engineer 1 phoned Operations Coordinator North. They decided to close NPD by 2pm to allow MBRC to open Young's Crossing for afternoon peak.	Correspondence	Flood Officer 2
11:15 AM	Flood Officer 9 called enquiring peak height and discharge at Lowood with Wivenhoe Dam gates closed. We decided to just minus 100 cumecs from previous estimation. He also wants FOC to email him the Lowood rating curve.	Correspondence	Flood Officer 2
11:33 AM	Engineer 1 called NPD Operator (re Directive 36)	Correspondence	Flood Officer 2
11:36 AM	Engineer 1 called Engineer 2. Engineer 2 will monitor situation overnight and Engineer 1 will become Duty Engineer again tomorrow.	Correspondence	Flood Officer 2
11:44 AM	Communications Advisor, Media and Ministerial (Seqwater) called to confirm whether we have closed all gates at Wivenhoe Dam. Flood Officer 2 said yes.	Correspondence	Flood Officer 2
1:07 PM	Dam Operations Manager called confirming NPD closure.	Correspondence	Flood Officer 2
1:35 PM	Communications Advisor, Media and Ministerial (Seqwater) called about Lowood pump motor sitting on the platform and wanting to know what flow will come down from Lockyer. Engineer 1 said about 300 cumecs.	Correspondence	Flood Officer 2
1:37 PM	Engineer 2 called. Flood Officer 8 will be on tonight (Flood Officer 2 should ring him this afternoon). Mt Crosby Weir gauge is broken so Water Treatment boys will give manual readings via BoM website. City gauge is currently reading 0.3 m high.	Correspondence	Flood Officer 2
2:10 PM	Engineer 1 advised MBRC that North Pine Dam gate operations had ceased at 14:00 and that Youngs Crossing should be clear of water within the next hour to an hour and half.	Correspondence	Engineer 1
2:15 PM	Engineer 1 called NPD Operator and indicated that Engineer 2 will be on call tonight monitoring the situation. NPD Operator advised that the tree branch snagged on Gate C had swung around and was now resting on pier - therefore okay. However a 75mm branch was caught in the ropes of Gate B and may need to be removed before another operation. Operations Coordinator North has organised for the Rangers to examine tomorrow.	Correspondence	Engineer 1
2:40 PM	Dam Operator 2 called from Somerset Dam and enquired as to proposed operational release strategy. Engineer 1 advised that no releases planned for now until Wivenhoe spillway issues are resolved.	Correspondence	Engineer 1
3:20 PM	Engineer 1 called MBRC Call Centre to provide heads up on possible gate operations tonight. Indicated that with 25mm over catchment we will commence gate operations at 21:00.	Correspondence	Engineer 1

APPENDIX N – FLOOD OPERATIONS ENGINEERS RESUMES

Engineer 1

SunWater Position Title

Headworks Design Manager

Business Group

Infrastructure Development

Location

Brisbane

Qualifications

- Bachelor of Engineering (Civil), Queensland University of Technology, 1983
- PostGrad Certificate in Hydrology, University of New South Wales, 1986

Professional Affiliations

- CPEng Institution of Engineers, Australia (NPER 3)
- Registered Professional Engineer, Queensland (No. 4887)
- Association of Professional Engineers, Scientists and Managers, Australia
- Australian Institute of Project Management (No. 7209)

Competencies/Professional Development

- Environmental Management Systems (ISO 14001)
- Project Management

Papers/Publications

- ANCOLD 2009, 2008, 2005, 2002
- HWRS 2005, 2003, 1999

Background

Engineer 1 has over 26 years experience in water engineering during which time he has gained expertise in hydrology and water resource studies. He is currently Headworks Design Manager of the major headworks design group which provides civil design services for a range of water supply infrastructure projects including dams, weirs and fish transfer systems. The team's 20 professional and technical staff are responsible to Engineer 1 for service delivery to both internal and external clients.

Engineer 1's main areas of interest concern design flood estimation and hydraulic modelling of flood plain flows and project management. He is proficient in the use of numerous hydrologic and hydraulic modelling packages and he is involved in leading a number of project teams.

Water Industry – Areas of Expertise

- Design Flood Hydrology
- River Hydraulic Modelling
- Water Resource Simulation
- Drought Management
- Environmental Flow Assessment
- Dam Safety and Risk Assessment

Key Skills / Proficiencies

- Project Management
- Flood Management and Operation

APPENDIX N – FLOOD OPERATIONS ENGINEERS RESUMES

Engineer 4

Engineer 4 is a Civil Engineer with almost 30 years experience in the Queensland Water Industry. Engineer 4 has held roles in design, construction and operations working on major bulk water supply projects throughout Queensland, including the Burdekin River Irrigation Project, Wivenhoe Dam and most of Queensland's major irrigation and bulk water supply projects. Engineer 4 is one of Australia's most experienced civil engineers in relation to the management of flood operations at gated dams, having at various times been responsible for managing operations and maintenance at eight major gated dams in Queensland and interstate.

For the last 15 years Engineer 4 has had responsibilities in flood management and operations at Wivenhoe and Somerset dams and is currently a Flood Operations Engineer for these dams as defined under the Water Supply Act 2008, one of a team of four.

As well as being an experienced civil engineer, Engineer 4 holds complementary tertiary qualifications in environmental impact assessment, infrastructure management, operations management, electrical engineering and computing.

Engineer 4 is currently responsible for Seqwater's dam safety management programs which include responsibilities for managing the structural safety at Seqwater's 25 dams and 52 weirs, responsibilities for water management and regulatory reporting in accordance with the Water Act 2000 and the Water Supply Act 2008 and management of Seqwater's hydrographic and seismic networks.

Ratings

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHECKED OR VERIFIED INFORMATION

STREAM HEIGHT STATION RATINGS

Calibration of the runoff routing model is performed by comparing modelled flows with estimated recorded flows. In turn, these estimated recorded flows are derived from recorded height through the appropriate stream rating curve. Thus rating curves are critical to the modelling process and it is important that there is an appreciation of the reliability of the reliability of the height to flow relationship at each site. One method of appreciating this reliability is by comparing the highest gauged (or measured) flow with the highest estimated recorded flow at each gauging station, sometimes termed the 'rating ratio'.

The rating reliability for the gauging stations is shown in the Table below:-

ALERT ID	Stream	Location	Rating Ratio (%)
6543	Cooyar Creek	Damsite	8
6718	Brisbane River	Linville	34
6521	Emu Creek	Boat Mountain	15
6515	Brisbane River	Gregors Creek	30
6554	Cressbrook Creek	Rosentretters	12
6527	Lockyer Creek	Helidon	23
6566	Tenthill Creek	Tenthill	21
6584	Laidley Creek	Showground Weir	21
6634	Lockyer Creek	Lyons Bridge	26
6631	Lockyer Creek	Rifle Range Road	40
6560	Brisbane River	Savages Crossing	60
6752	Brisbane River	Mt Crosby Weir	25
6581	Bremer River	Adams Bridge	45
6551	Bremer River	Walloon	?
6563	Warrill Creek	Kalbar	39
6632	Warrill Creek	Amberley	19

APPENDIX U

Wivenhoe Dam Hydrology Reports

Draft Only THIS DOCUMENT CONTAINS NO CHECKED OR VERIFIED INFORMATION

The reports contained in the following listing can be used to show that a flood event similar in magnitude and circumstances to the January 2011 Flood Event would be expected to result in urban damage below Moggill if both Wivenhoe Dam and Somerset Dam are operated under their current full supply levels.

When examining these reports it is important to understand that the January 2011 Flood Event is defined by its peak flow of 12000 m³/s and its volume of 2,650,000 megalitres. The AEP of the event cannot be generally be reconciled across all of the listed reports for the following three reasons:

- The accepted techniques for estimating design rainfall and flood AEP information have been changed on five occasions since 1977. Modelling techniques have also changed and this also impacts on AEP estimations.
- Across the listed reports the implied AEP for the January 2011 Flood Event ranges between 1 in 200 and 1 in 2000.
- The January 2011 Flood Event is represented by two individual floods, with peak inflows from each flood greater than 10000 m³/s, separated by 30 hours. The probability of two such flood peaks occurring within 36 hours of each other is considered to be appreciably uncommon and would impact on the AEP of the event.
- An event with a hydrograph similar to the January 2011 Flood Event has not been modeled in any report listed. This is because reports consider idealised storms and historical events and an event similar in nature to the January 2011 Flood Event has never been recorded.

EXECUTIVE SUMMARY

Somerset Dam and Wivenhoe Dam are located in the Brisbane River Basin. The Dams are dual purpose storages that provide urban water supplies (including drinking water) to South East Queensland, as well as flood mitigation benefits to areas impacted by flood flows along the Brisbane River below Wivenhoe Dam.

Deleted:

In the 25 days prior to Thursday 6 January 2011, above-average levels of rainfall were received in the Dam catchment areas and the Dams successfully operated as flood mitigation dams on a number of occasions during this period. Further rain fell in the Dam catchments on Thursday 6 January 2011, leading to another mobilisation of Seqwater's Flood Operations Centre. The rainfall continued in various parts of the Brisbane River Basin until Wednesday 12 January 2011, resulting in the largest inflows into both Dams ever recorded. During this time, and for a period following the peak of the floods, the Dams were operated as flood mitigation storages in accordance with *The Manual of Operational Procedures for Flood Mitigation at Wivenhoe Dam and Somerset Dam (Revision 7) ("the Manual")*. The Manual defines the objectives and procedures for operating Somerset Dam and Wivenhoe Dam during flood events. An understanding of the Manual is important when reading this Report.

Deleted: four weeks

Deleted:

The January 2011 Flood Event, which impacted the Dams between Thursday 6 January 2011 and Wednesday 19 January 2011, can be categorised as a large (Annual Exceedance Probability of 1 in 100) to rare (Annual Exceedance Probability of 1 in 2,000 years) event as defined by *Australian Rainfall and Runoff (Book 6) (AR&R)*. Studies associated with the design and operation of Wivenhoe Dam that date back to 1971, indicate a flood of this magnitude would be expected to result in urban damage below Moggill. The *Wivenhoe - Somerset Interaction Study*, which was prepared to support the 2009 review of the Manual, is the most recent investigation undertaken that supports this expectation.

Background

Flood events that impact Somerset Dam and Wivenhoe Dam are caused by rainfall events that vary in intensity, duration and distribution over a catchment area exceeding 7,000km² above the Dams. When making decisions about releasing water from the Dams during flood events, consideration is also given to rain falling in Brisbane River catchment areas not controlled by the Dams. These catchment areas, which include the Lockyer Creek and Bremer River catchments, also cover an area in the order of 7,000km² and rain falling in these catchments will also vary in intensity, duration and distribution. Accordingly, the Manual must account for an infinite number of flood event scenarios.

The current ability of the Bureau of Meteorology to (BoM) to provide rainfall forecasts for the Dam catchment areas is not sufficiently accurate to make operational decisions of releases from the Dams. A degree of uncertainty exists in all weather forecasts, particularly rainfall forecasts, and the longer the forecast lead times, the greater the degree of uncertainty of the forecast.

Deleted: level of forecasting technology does not make it possible for the Bureau of Meteorology

Deleted: completely accurate

As it is not possible to provide a specific procedure for Dam operation during every possible flood event, the Manual takes the approach of providing objectives and strategies to guide operational decision-making during a flood event. The objective followed and strategy chosen at any point in time depends on the actual water levels in the Dams, as well as flood modelling predictions based on the best observed rainfall, forecast rainfall and stream flow information available at the time.

Deleted: further forward in time forecasts are provided

Deleted: there is

Deleted: and

It is not possible to predict the range of objectives and strategies that will be used during the course of a flood event, before or at any time during the event, prior to the event peak. Objectives and strategies change as flood events progress, as rainfall is received in the catchment and as forecast rainfall amounts change. For small floods, objectives and strategies relate to minimising flood impacts in rural areas, while as the scale of the flood increases, the emphasis changes to protecting urban areas and maintaining the structural safety of the Dams.

The primary objectives of the Manual, in order of importance, are:

- Ensure the structural safety of the Dams;
- Provide optimum protection of urbanised areas from inundation;
- Minimise disruption to rural life in the valleys of the Brisbane and Stanley Rivers;

EXECUTIVE SUMMARY (continued)

- Retain the storage at Full Supply Level (FSL) at the conclusion of the flood event;
- Minimise impacts to riparian flora and fauna during the drain down phase of the flood event.

While ensuring the Dams are operated during flood events within these objectives, Seqwater's duty of care to the public is also a primary consideration when making flood releases from the Dams. Every attempt is made to ensure public roads are closed prior to inundation by Dam outflows and that authorities are provided with enough time to prepare for community isolations and to undertake evacuations. These actions are in accordance with draft Communication Protocol prepared by the Department of Environment and Resource Management to ensure information is effectively communicated to the public during flood events impacting the Dams. Every attempt is also made to ensure urban damage is minimised, and that Dam outflows with the potential to contribute to urban damage are delayed until it is apparent no other options are available without risking the safety of the Dams.

Deleted: always operating

It is also important to note that, under the Manual's current operating rules, both Somerset Dam and Wivenhoe Dam are expected to fail during the Probable Maximum Flood, if such an event ever occurs.

Significance of the January 2011 Flood Event

The January 2011 Flood Event has been defined as a large to rare event by AR&B, the Institution of Engineers Australia (Engineers Australia), national guidelines for the estimation of design flood characteristics. The flood level classifications adopted by the BoM define the Event as a major flood. Relevant statistics that demonstrate this are:

- Rainfall recorded in the catchment area above Wivenhoe Dam indicates the catchment average rainfall intensity for the 72-hour period to Tuesday 11 January 2011 at 19:00 had an Annual Exceedance Probability (AEP) between 1 in 100 and 1 in 200. The catchment average rainfall intensity for the 120-hour period to Tuesday 11 January 2011 at 19:00 also had an AEP between 1 in 100 and 1 in 200. At some individual rainfall stations within the Brisbane River catchment, rainfall estimates beyond the credible limit of extrapolation (AEP of 1 in 2,000) were recorded for durations between 6 hours and 48 hours.
- On the morning of Tuesday, 11 January 2011, water levels in Wivenhoe Dam began rising rapidly in response to very heavy localised rainfall in the area immediately upstream of the Dam. At the time, the BoM radar indicated this rain was located in an area which did not have any real time rain gauges. Post flood analysis suggests the rainfall required to reproduce this rise could exceed an AEP of 1 in 2,000 and may be well into the extreme category. Rainfall of this intensity and duration over the Wivenhoe Dam lake area at such a critical stage of the Flood Event was unprecedented.
- The volume of total inflow into Wivenhoe Dam during the Event was 2,650,000ML. This volume has been calculated to be almost double (190%) the comparable volume of inflow from the January 1974 flood event, and comparable with the flood of 1893.
- The inflow into Wivenhoe Dam during the Event is characterised by two distinct flood peaks, with each peak separated by about 30 hours. The maximum flow rate at the first peak is estimated to be around 200% of the comparable flow rate calculated from the January 1974 event, while the maximum flow rate at the second peak is estimated to be approximately 230% of the comparable flow rate from the January 1974 event (Source of January 1974 flow: Brisbane River and Pine River Flood Study, October 1994, Report No. 23a).

The peak water level recorded at many gauges in the Brisbane River, including the Brisbane City gauge, exceeded the major flood level.

Operations during the January 2011 Flood Event

1. During the January 2011 Flood Event, operational decisions were made in accordance with the Manual. Dam outflows contributing to downstream flooding were delayed until it was apparent no other option was available, without risking the safety of Wivenhoe Dam.
2. Two distinct flood peaks entered Wivenhoe Dam during the Event. The first flood into Wivenhoe Dam was similar in nature and magnitude to the comparable flood flows of the January 1974 event. The combined mitigation effect of Somerset and Wivenhoe Dams ensured this first flood did not result in urban damage below Moggill, however, achieving this result did cause significant filling of the Dams' flood storage compartments.
3. The second flood was also similar in nature and magnitude to the comparable flood flows of the January 1974 event. Rainfall which occurred directly on and near the Wivenhoe Dam lake area contributed to the second flood. Post flood analysis suggests the intensity of this rainfall could have exceeded an AEP of 1 in 2,000 and may be well into the extreme category. The location of this rainfall on and near the Dam also reduced available mitigation options.
4. Due to the level to which the flood compartments were filled by the first flood, the second flood could not be completely contained without risking the safety of the Dams and, therefore, the inflow of water to the Brisbane River resulted in urban damage below Moggill. The extent of this damage, however, was greatly reduced by the operation of the Dams.

 Deleted: the

Rainfall forecasts in the early stages of the Event did not support flood releases being made from Wivenhoe Dam, greater than those that actually occurred. An increase to flood releases in the later stages of the Event (prior to the morning of Tuesday 11 January 2011) had the potential to increase urban damage, due to the possible southward movement of the prevailing weather system. Had the rainfall on Tuesday 11 January 2011 largely fallen in catchments downstream of the Dam, the transition to an operating strategy to protect the safety of the Dam may have been avoided, however, urban damage would have likely increased under this scenario, due to a lack of the mitigation effects that would have been provided by the Dam.

Deleted: south
 Deleted: the loss of the

Given the current level of forecasting technology available, there was an extremely high degree of difficulty in predicting the actual quantity, intensity and spatial distribution of the Event rainfall. This resulted in a high level of uncertainty in predicting the likely Dam inflows in advance of rainfall on the ground and is demonstrated by the three-day and five-day forecast rainfall model results.

The available recorded data shows the January 2011 Flood Event was unprecedented in the history of Somerset and Wivenhoe Dams and rivals the largest floods in the recorded flood history of the region. However, the successful operation of the Dams as flood mitigation storages is considered to have had a major effect on reducing the flood damages in the areas downstream of the Dams.

Deleted: available

Flood mitigation benefits of Somerset Dam and Wivenhoe Dam

Wivenhoe Dam provided clear and greatly significant flood mitigation benefits during the January 2011 Flood Event, as demonstrated below:

- Figure 9.1.2 demonstrates the significant mitigation benefits of Wivenhoe Dam during this Flood Event. The peak of the outflow from the Dam was approximately 40% lower than the peak of the inflow, meaning that just below the Dam, the maximum hourly flow rate in the Brisbane River was reduced by around 40%.
- Without the mitigating effects of Wivenhoe Dam, the peak flood height measured at the Port Office gauge near the Brisbane CBD would have been approximately 2.0m higher than was experienced.
- Based on the current damage curves, these projected reductions in the flood peak height equate to significant reductions in the potential for the loss of life as well as monetary savings in regard to property damages in the order of up to \$5 billion. (Source: Flood Damage Tables - River PMF tab; provided to Seqwater by Brisbane City Council).
- Without the above flow rate reductions provided by Wivenhoe Dam, it is estimated up to 14,000 more properties would have been impacted by the January 2011 Flood Event. (Source: Flood Damage Tables - River PMF tab; provided to Seqwater by Brisbane City Council).

EXECUTIVE SUMMARY (continued)

- The Brisbane River has a catchment area of 13,570 km² to Brisbane. Wivenhoe Dam and Somerset Dam control an area of 7,040 km². The remaining catchments are uncontrolled and cover an area of 6,530 km². During the critical period of the Event from 11 January 2011 to 14 January 2011 when the major flooding occurred in the urban areas, there were significant flows from catchments downstream of Wivenhoe Dam which, on their own, would have resulted in damaging flooding in the urban areas of Ipswich and Brisbane.

Conclusions

The significant conclusions drawn from the information contained in this Report include:

- During the January 2011 Flood Event, Somerset Dam and Wivenhoe Dam were operated in accordance with *The Manual of Operational Procedures for Flood Mitigation at Wivenhoe Dam and Somerset Dam (Revision 7)*.
- The data collection and flood modelling systems used to support decisions made during the Event performed well and assisted informed decision-making, in accordance with the Manual.
- BoM rainfall forecasts did not support the additional release of flood water early in the Event.
- During the Event, Seqwater followed the Department of Environment and Resource Management's draft Communications Protocol, which was compiled after the October 2010 flood event. This Protocol was developed to ensure effective communication between local, State and Commonwealth agencies impacted by the release of floodwater from the Dams.
- The January 2011 Flood Event was an extremely large and rare flood event. The combined effects of Somerset Dam and Wivenhoe Dam did reduce flood damages downstream, however, they could not fully mitigate the impacts of the Event without putting the safety of the Dams at risk.
- Studies associated with the design and operation of Wivenhoe Dam, dating back to 1971, indicate a flood of the magnitude of the January 2011 Flood Event would be expected to result in urban damage below Moggill.
- The combined effects of Somerset Dam and Wivenhoe Dam provided clear and significant flood mitigation benefits during the January 2011 Flood Event.

1.1 Preface

Given the potential significant impact on downstream populations and property, it is imperative Somerset and Wivenhoe Dams are operated during flood events in accordance with clearly defined and pre-determined procedures. The current procedures are contained in Revision 7 of *The Manual of Operational Procedures for Flood Mitigation at Wivenhoe Dam and Somerset Dam* ("the Manual") that was gazetted in January 2010. The Manual is an approved flood mitigation manual under the *Queensland Water Supply (Safety and Reliability) Act 2008*. An understanding of the Manual is important when reading this Report.

The Manual requires the owner of Somerset and Wivenhoe Dams (currently Seqwater) to prepare a report after each flood event impacting the Dams. A flood event is defined as a situation where either Somerset and or Wivenhoe Dams exceed their Full Supply Level (FSL) and flood water releases are made. The report must contain details of the procedures used during the flood event, the reasons why procedures were used and other pertinent information. Seqwater must forward the report to the Director-General of the Department of Environment and Resource Management (DERM) within six weeks of the completion of the flood event.

Deleted:

This document and its associated volumes comprise the required report relating to the January 2011 Flood Event, which impacted Somerset and Wivenhoe Dams, commencing on Thursday 6 January 2011 and concluding on Wednesday 19 January 2011. It is due for submission by Wednesday 2 March 2011.

1.2 Meaning of terms

In this report, the following terms are defined as below:

"Act" means the Water Supply (Safety and Reliability) Act 2008;

"AEP" means annual exceedance probability, the probability of a specified event being reached or exceeded in any one year. This may be expressed as a ratio (e.g. 1 in Y) or a percentage;

Deleted: n

"Agency" includes a person, a local government and a department of state government within the meaning of the *Acts Interpretation Act 1954*;

"AHD" means Australian Height Datum;

"ALERT" means Automated Local Evaluation in Real Time System, a system of monitoring and displaying rainfall and water level data. It is a combination of field stations, communications networks and data collection software;

Deleted: and

"AMTD" means the Adopted Middle Thread Distance, which is the distance along the centre line of the mainstream from a junction, usually in kilometres;

"API" means

Formatted: Highlight

"AR&R" means *Australian Rainfall and Run-off (Book 6), The Institution of Engineers Australia (Engineers Australia) national guidelines for the estimation of design flood characteristics*;

Formatted: Font: 9 pt, Italic

Formatted: Font: Not Italic

"BOM" means the Bureau of Meteorology;

Formatted: Font: (Default) Arial, 9 pt, Font color: Auto

"Chairperson" means the Chairperson of Seqwater;

Formatted: Font color: Auto, English (Australia)

"Chief Executive" means the Director-General of the Department of Environment and Resource Management or nominated delegate;

Deleted:

"Controlled Document" means a document subject to managerial control over its contents, distribution and storage. It may have legal and contractual implications;

"Dams" means Somerset Dam and Wivenhoe Dam;

1 INTRODUCTION (continued)

"**Dam Crest Flood**" means the flood event which, when routed through the storage with the storage initially at Full Supply Level, results in the still water level in the storage reaching the lowest point in the dam embankment, excluding wind and wave effects;

"**Dam Supervisor**" means the senior on-site officer at Somerset or Wivenhoe Dam as the case may be;

"**DERM**" means the Queensland Government department, the Department of Environment and Resource Management;

"**Duty Flood Operations Engineer**" means the Senior Flood Operations Engineer or Flood Operations Engineer rostered on duty to be in charge of Flood Operations at the Dams;

"**EL**" means elevation in metres Australian Height Datum;

"**Enviromon**" is the Bureau of Meteorology data collection software used to collect and display rainfall and water level data;

"**ERRTS**" means Event Reporting Radio Telemetry System;

"**Flood Event**" is a situation where the Duty Flood Operations Engineer expects the water level in either of the Dams to exceed the Full Supply Level;

"**FLOOD-Col**" is the data collection software used in the Flood Operations Centre to collect and display rainfall and water level data;

"**FLOOD-Ops**" is the modelling software used in the Flood Operations Centre to model the runoff from the catchments;

"**Flood Operations Centre**" means the office location used by Flood Operations Engineers during a Flood Event to manage the Event;

"**Flood Operations Engineer**" means a person designated to direct flood operations at the Dams in accordance with Section 2.4 of the Manual;

"**Flood Operations Engineers**" means the collective group of persons who individually have designation as either a **Flood Operations Engineer** or a **Senior Flood Operations Engineer**;

"**Flood Operations Manager**" means the Flood Operations Engineer responsible for the overall management of the Flood Operations Centre leading up to or during a Flood Event;

"**FSL**" or "**Full Supply Level**" means the level of the water surface when the reservoir is at maximum operating level, excluding periods of flood discharge;

"**Gauge**" when referred to in (m) means river level referenced to AHD or a local datum, and when referred to in (m³/s) means flow rate in cubic metres per second;

"**IFD**" means Intensity, Frequency, Duration and refers to the statistical analysis of rainfall intensities;

"**Manual**" or "**Manual of Operational Procedures for Flood Events at Wivenhoe Dam and Somerset Dam**" means the current version (Revision 7) of the Manual;

"**m³/s**" means a rate of water flow being one cubic metre of water per second or 1,000 litres of water per second;

"**OOA**" means 'out of action' in relation to the operation of a rainfall or river height gauge that provides catchment data;

1 INTRODUCTION (continued)

“Operating Target Line” means the Wivenhoe/Somerset Operating Target Line from Strategy S2 of the Manual;

“Power Station” means the Wivenhoe pumped storage hydro-electric power station associated with Wivenhoe Dam and Splityard Creek Dam;

“Protocol” means draft Communication Protocol prepared by DERM to ensure information is effectively communicated to the public during flood events impacting Somerset Dam and Wivenhoe Dam.

Formatted: Font: Bold

“QPF” means Quantitative Precipitation Forecast provided by the Bureau of Meteorology and is an estimate of the predicted rainfall in millimetres, usually in the next 24 hours;

“RTFM” means Real Time Flood Model and is a combination of Flood_Col, Flood_Ops and other ancillary software;

“SD” means State Datum, which is a level height datum that is different from AHD.

“Senior Flood Operations Engineer” means a person designated in accordance with Section 2.3 of the Manual under whose general direction the procedures in the Manual must be carried out;

“Seqwater” means the Queensland Bulk Water Supply Authority, trading as Seqwater;

“URBS” means Unified River Basin Simulator.

Note: Dam levels in this document represented as metres (m) are metres Australian Height Datum (m AHD).

Deleted: ¶

1.3 Background

The primary objectives of the procedures contained in the Manual, in order of importance, are:

1. Ensure the structural safety of the Dams;
2. Provide optimum protection of urbanised areas from inundation;
3. Minimise disruption to rural life in the valleys of the Brisbane and Stanley Rivers;
4. Retain the storage at Full Supply Level (FSL) at the conclusion of the flood event;
5. Minimise impacts to riparian flora and fauna during the drain down phase of the flood event.

In meeting these objectives, the Dams must be operated to account for the potential effects of closely spaced flood events. Normal operating procedures require stored floodwaters to be emptied from the Dams within seven days of the flood event peak passing through the Dams. During flood events, Somerset Dam and Wivenhoe Dam are operated in conjunction to maximise the overall flood mitigation capabilities of the two Dams.

Deleted: ¶

1.3.1 Wivenhoe Dam

Wivenhoe Dam is a dual purpose storage facility that provides urban water supplies (including drinking water) to South East Queensland, as well as flood mitigation benefits to areas impacted by flood flows along the Brisbane River below the Dam. Depending on the origin, magnitude and spatial extent of the flood, Wivenhoe Dam can be operated in a number of ways to reduce flooding downstream of the Dam. Maximum overall flood mitigation can be achieved by operating Wivenhoe Dam in conjunction with Somerset Dam.

Deleted:

The capacity of the urban water supply compartment that relates to Wivenhoe Dam's FSL is 1,165,000ML. The reservoir volume above the FSL that is used as temporary flood storage is 1,450,000ML. How much of this flood storage compartment is utilised during a flood event depends on the initial reservoir level below the FSL, the magnitude of the flood being regulated and the procedures adopted.

Deleted: the

Deleted: full supply volume

1 INTRODUCTION (continued)

Radial gates and an auxiliary spillway are the primary infrastructure used to release water during flood events at Wivenhoe Dam. The arrangement of the radial gates is shown in Figure 1.4.1.

Figure 1.4.1 – Wivenhoe Dam Infrastructure – arrangement of radial gates

An auxiliary spillway was constructed in 2005 as part of an upgrade to improve Wivenhoe Dam's flood adequacy. The auxiliary spillway consists of a three bay fuse plug spillway at the right abutment. In association with other constructions at the Dam, the spillway gives the Dam Crest Flood an AEP of approximately 1 in 100,000 years.

Deleted: the
 Deleted: immunity
 Deleted: is

Once a flood event is declared, the magnitude of the event is assessed by predicting:

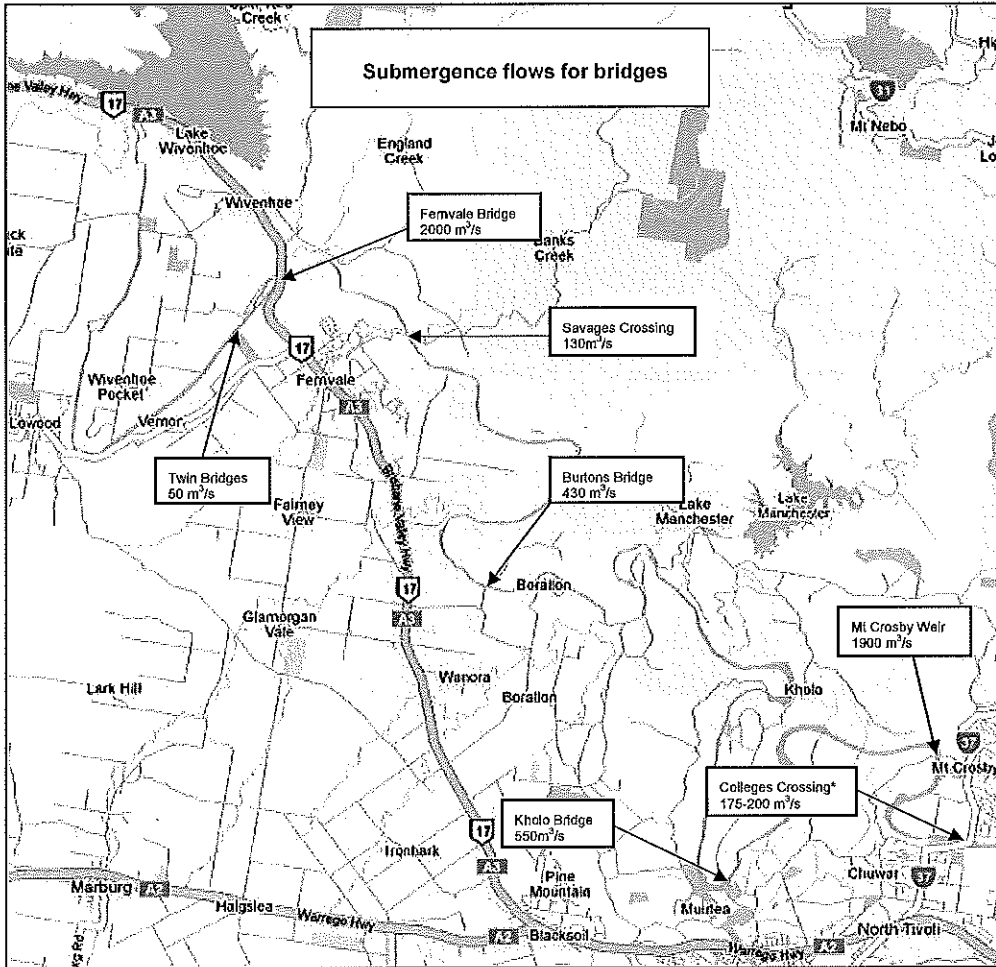

- The maximum storage levels in Somerset and Wivenhoe Dams;
- The peak flow rate at the Lowood gauge, excluding Wivenhoe Dam releases;
- The peak flow rate at the Moggill gauge, excluding Wivenhoe Dam releases.

According to the Manual, the spillway gates are not to be opened for flood control purposes prior to the reservoir level exceeding 67.25m.

Deleted: T

The strategies contained in the Manual require significant control over Dam releases to be exercised, as well as knowledge of flows into the Brisbane River from both Lockyer Creek and the Bremer River, below Wivenhoe Dam.

In small floods, releases are controlled to ensure the combined flow from Lockyer Creek and Wivenhoe Dam is less than the limiting values contained in the strategies, to delay the submergence of bridges and to minimise disruption to rural life in the Brisbane and Stanley River valleys. Figure 1.4.2 shows the location of bridges impacted by Dam releases and the approximate river flow rate at which they are closed to traffic.

Figure 1.4.2 – Submergence flows for bridges

During larger floods, releases from Wivenhoe Dam are controlled to protect urbanised areas from inundation. The releases are controlled so the combined flows from Wivenhoe Dam, Lockyer Creek and the Bremer River are either minimised or kept below the threshold level for urban damage, which is 4,000m³/s at Moggill.

Deleted: the

Deleted: is

In large flood events, releases from Wivenhoe Dam are also controlled to ensure the structural safety of the Dam is not put at risk of failure.

Deleted: ¶

1.5 Somerset Dam

Somerset Dam is able to be operated in a number of ways to regulate the flood level of Stanley River. Somerset and Wivenhoe Dams are to be operated in conjunction to optimise the flood mitigation benefits downstream of Wivenhoe Dam. Radial gates, sluice gates and regulator valves are the primary infrastructure used to release water during flood events at Somerset Dam. The arrangement of this infrastructure is shown in Figure 1.5.1.

Formatted: Not Highlight

1 INTRODUCTION (continued)

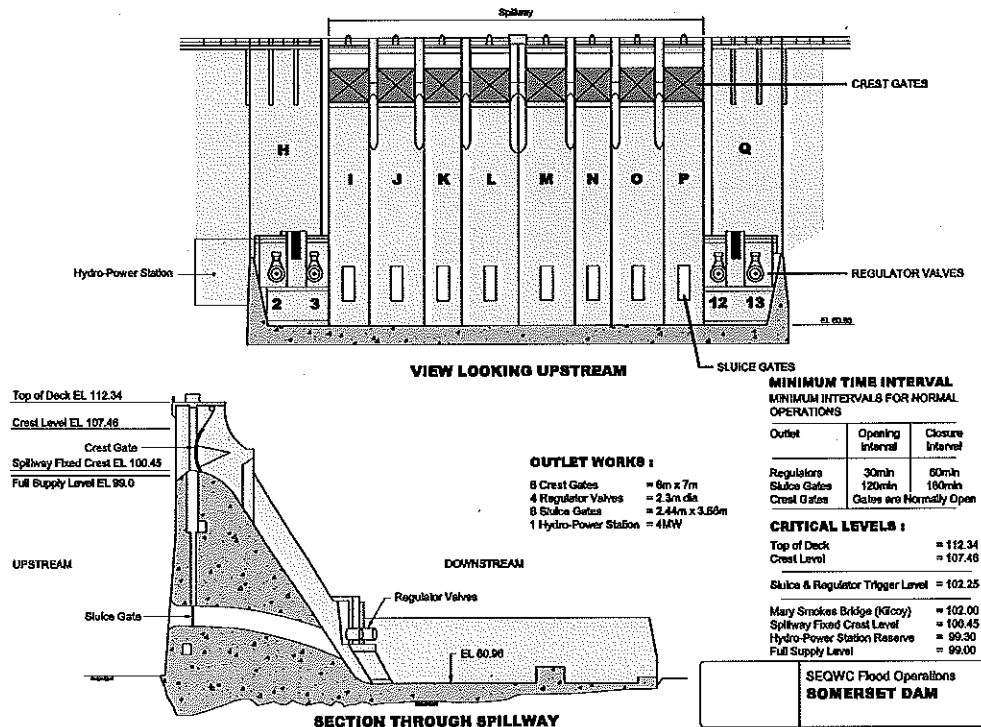

Figure 1.5.1 - Somerset Dam Infrastructure - arrangement of radial gates, sluice gates and regulator valves

1.6 Operating Somerset Dam in conjunction with Wivenhoe Dam

The strategies used to operate Somerset Dam during a flood event are intended to maximise the benefits of the flood storage capabilities of the Dam while protecting the structural safety of both Somerset and Wivenhoe Dams. To achieve this, a Wivenhoe/Somerset Operating Target Line (Figure 1.6.1) is used to set a goal for balancing the use of the flood storage in each Dam.

The Wivenhoe/Somerset Operating Target Line was selected based on the following factors:

- Equal minimisation of flood level peaks in both Dams in relation to their associated failure levels;
- Minimisation of flows in the Brisbane River downstream of Wivenhoe Dam;
- Consideration of the time needed at the onset of a flood event to properly assess the magnitude of the flood event and the likely impacts. This is to ensure the likely optimal strategy to maximise the flood mitigation benefits of the storages can be selected.

The target point on the Operating Target Line at any point in time is based on the maximum storage levels in Somerset and Wivenhoe Dams, using the best forecast rainfall and stream flow information available at the time. Gate operations enable the progressive movement of the duty point towards the target line. It is not necessarily possible to adjust the duty point directly towards the target line in a single gate operation.

2 FLOOD EVENT SUMMARY

2.1 Summary of the January 2011 Flood Event

The following summary must be read in conjunction with *The Manual of Operational Procedures for Flood Mitigation at Wivenhoe Dam and Somerset Dam (Revision 7)* ("the Manual"). It provides a detailed summary of the operation of Somerset and Wivenhoe Dams during the January 2011 Flood Event. Each table below covers a period of the Event during which one of the following occurred:

- There was a transition or change to the flood operation strategy used, as defined by the Manual;
- There was a period of stability during which no gate operations from either Somerset Dam or Wivenhoe Dam were directed;
- There was a period of sustained gate operations (either opening or closing) at either Somerset Dam or Wivenhoe Dam.

Each table also provides a summary of relevant background information and a summary of the information that was used to make decisions during the period covered by the table. This information includes:

- Details of the time period;
- Relevant background information from the period leading up to and during the period;
- Changes in Dam conditions during the period;
- Rainfall information (including forecast rainfall) and model results available during the period;
- The strategy used and/or adopted during the period.

The source data for the information shown in the tables below can be found in the following Appendices of this Report:

- Appendix A – Model results
- Appendix B – Flood volume summary
- Appendix C – Quantitative Precipitation Forecasts (QPF)
- Appendix D – Catchment rainfall
- Appendix E – Situation reports
- Appendix G – Severe weather warnings
- Appendix H – Flood Event notification email
- Appendix L – Flood operations directives
- Appendix M – Flood Event log

Note: Dam levels in this document represented as metres (m) are in metres Australian Height Datum (m AHD).

2 FLOOD EVENT SUMMARY (continued)

January 2011 Flood Event – Period 1 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
Commenced Thursday 06 Jan 2011 07:42	<p>Strategy W1A and Strategy W1B; and Strategy S2</p> <ul style="list-style-type: none"> Catchment conditions prior to the Event are as described in Section 3.1. The Event was considered a continuation of the ongoing wet period that commenced in October 2010, <u>24/7 monitoring of conditions by an Engineer was occurring.</u> Little rainfall occurred in the 24 hours to 09:00 on 5 Jan 2011. Catchment average rainfalls in the 24 hours to 08:00 on 6 Jan 2011 were: <ul style="list-style-type: none"> Wivenhoe Dam 25mm; Somerset Dam 21mm; Lockyer Creek 23mm; Bremer River 23mm. Event mobilisation occurred at 07:42 on 6 Jan 2011, using Strategies W1A and S2. Once mobilisation occurred, 24/7 staffing of the Flood Operations Centre and Dams continued until official de-mobilisation was announced. This occurred at 12:00 on 19 Jan 2011. Duty Engineer was called back early from holidays to assist with the management of the Event. Transitioned from Strategy W1A to W1B once the Wivenhoe lake level exceeded 67.50m. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 53mm; Somerset Dam 44mm; Lockyer Creek 53mm; Bremer River 54mm. <p>Wivenhoe Dam level rose from 67.31m to 67.52m over the 18-hour period.</p> <p>Somerset Dam level rose from 99.34m to 99.55m over the 18-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 28mm; Somerset Dam 23mm; Lockyer Creek 30mm; Bremer River 31mm. Forecast 24-hour catchment average rainfall at 16:00 on 6 Jan 2011 was 25mm. Estimated peak Wivenhoe Dam level: 68.2m (excluding forecast); 68.7m (including forecast). Estimated peak Somerset Dam level: 99.7m (excluding forecast); 100.1m (including forecast). Estimated total Dam inflow: 204,000ML (excluding forecast); 343,000ML (including forecast). Estimated peak flow at Lowood excluding Wivenhoe Dam releases: 470m³/s (excluding forecast); 720m³/s (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: 550m³/s (excluding forecast); 960m³/s (including forecast). These peaks were not expected to occur for more than 24 hours beyond period end. Colleges Crossing remained open in the short term. Estimated peak Wivenhoe Dam outflow: 1,220m³/s (excluding forecast); 1,260m³/s (including forecast). 	<p>Strategy W1A and Strategy W1B Strategy S2 (Lake level greater than 67.25m, maximum release 110m³/s)</p> <ul style="list-style-type: none"> Peak inflows into the Brisbane River from Lockyer Creek were estimated to be in the order of 400m³/s. These flows would not inundate Colleges Crossing until the morning of 7 Jan 2011. Lake level was not expected to reach 67.50m (Strategy W1B) until 7 Jan 2011. Lake level may not exceed 68.5m. Endeavoured to keep Colleges Crossing trafficable by limiting combined flows from Wivenhoe Dam and Lockyer Creek to a maximum of 175m³/s. Water was held in Wivenhoe Dam in an attempt to keep Colleges Crossing trafficable in accordance with Strategy W1A. Low level releases continued from the Mini-Hydro at this time and at various stages during the Event. However, these releases (in the order of 13m³/s) have low relative significance and are not referred to specifically in the remainder of this summary document. In accordance with Strategy S2, the crest gates at Somerset Dam were raised to enable uncontrolled discharge. The low level sluices were kept closed. Some regulator releases continued from December as part of previous event drain down, (in the order of 35m³/s) and these were shut down at 18:00 on 7 Jan 2011.

2 FLOOD EVENT SUMMARY (continued)

January 2011 Flood Event – Period 3 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Friday 07 Jan 2011 09:00</p> <p>Completed Friday 07 Jan 2011 15:00</p>	<p>Strategy W1C and Strategy S2</p> <ul style="list-style-type: none"> At around 09:00 it became apparent flows from Lockyer Creek into the Brisbane River, combined with local Brisbane River inflows downstream of Wivenhoe Dam, would be sufficient to inundate all bridges below the Dam, with the exception of Mt Crosby Weir Bridge and Fernvale Bridge. Burtons Bridge was inundated by natural river flows near the end of this period. All impacted Councils were notified of the situation and that releases would commence from Wivenhoe Dam. Releases were timed to occur at 15:00 to allow bridges to be closed and arrangements to be made to cater for rural community isolation. The impacted rural communities had been isolated over the Christmas period and time was needed for suitable arrangements to be made to allow these communities to prepare for another potentially extended period of isolation. Releases were timed to start in accordance with the Manual requirements of keeping Burtons Bridge and Kholo Bridge open to traffic when operating under Strategy W1C. Transitioned from Strategy W1C to Strategy W1D, once the Wivenhoe Dam lake level exceeded 68.0m. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 89mm; Somerset Dam 90mm; Lockyer Creek 71mm; Bremer River 71mm. <p>Wivenhoe Dam level rose from 67.75m to 68.03m over the six-hour period.</p> <p>Somerset Dam level rose from 99.65m to 99.94m over the six-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 25mm; Somerset Dam 30mm; Lockyer Creek 14mm; Bremer River 11mm. Forecast 24-hour catchment average rainfall at 10:00 on 7 Jan 2011 was 25mm. Estimated peak Wivenhoe Dam level: 68.4m (excluding forecast); 68.9m (including forecast). Estimated peak Somerset Dam level: 100.3m (excluding forecast); 100.6m (including forecast). Estimated total Dam inflow: 346,000ML (excluding forecast); 483,000ML (including forecast). Estimated peak flow at Lowood excluding Wivenhoe Dam releases: 530m³/s (excluding forecast); 710m³/s (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: 660m³/s (excluding forecast); 1,040m³/s (including forecast). Estimated peak Wivenhoe Dam outflow: 1,240m³/s (excluding forecast); 1,270m³/s (including forecast). 	<p>Strategy W1C (Lake level greater than 67.75m, maximum release 500m³/s)</p> <ul style="list-style-type: none"> Due to the further rain and observed stream rises, it became apparent flows from Lockyer Creek into the Brisbane River, combined with local Brisbane River inflows downstream of Wivenhoe Dam, would be sufficient to inundate all bridges downstream of the Dam, with the exception of the Mt Crosby Weir Bridge and Fernvale Bridge. Releases from Wivenhoe Dam were managed in an attempt to ensure Mt Crosby Weir Bridge and Fernvale Bridge remained trafficable in accordance with Strategies W1D and W1E. In accordance with Strategy S2, the crest gates at Somerset Dam were raised to enable uncontrolled discharge, and the low level regulators and sluices at Somerset Dam were kept closed.

2 FLOOD EVENT SUMMARY (continued)

January 2011 Flood Event – Period 4 of 20

Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Friday 07 Jan 2011 15:00</p> <p>Completed Saturday 08 Jan 2011 14:00</p>	<p>Transition from Strategy W1D to W1E to W3; and Strategy S2 to W3; and Strategy S2 to W3; and Strategy S2 to W3.</p> <p>Wivenhoe Directives #1 to #4.</p> <p>Somerset Directives #1 to #3.</p> <ul style="list-style-type: none"> Gates opened continuously at Wivenhoe Dam for 23 hours, in accordance with standard gate opening sequence at a rate of 0.5m of individual gate opening per hour. Transitioned from Strategy W1D to W1E when the Wivenhoe Dam level exceeded 68.25m (22:00 on 7 Jan 2011). Transitioned from Strategy W1E to W3 as it became apparent Wivenhoe Dam level would exceed 68.50m (08:00 on 8 Jan 2011). Strategy W2 was by-passed as it was not possible to achieve this strategy by limiting the flow in the Brisbane River to less than the naturally occurring peaks at Lowood and Moggill. This is because the calculated naturally occurring peaks at Lowood and Moggill were 530m³/s and 770m³/s respectively, whereas the release rate from the Dam was already 940m³/s. Limiting releases to these naturally occurring peak flows would also have compromised the Dam drain down requirements. At 14:00 on 8 Jan 2011, Wivenhoe Dam discharge was 1,239m³/s. All rural bridges below the Dam, with the exception of Mt Crosby Weir Bridge and Fernvale Bridge, were flooded. 	<p>Total rainfall from 0800 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 92mm; Somerset Dam 95mm; Lockyer Creek 72mm; Bremer River 72mm. <p>Wivenhoe Dam level rose from 68.03m to 68.61m over the 23-hour period.</p> <p>Somerset Dam level rose from 99.94m to 100.44m over the 23-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 3mm; Somerset Dam 5mm; Lockyer Creek 1mm; Bremer River 1mm. Forecast 24-hour catchment average rainfall at 10:00 on 8 Jan 2011 was 40mm. Estimated peak Wivenhoe Dam level: 68.7m (excluding forecast); 69.1m (including forecast). Estimated peak Somerset Dam level: 100.5m (excluding forecast); 100.6m (including forecast). Estimated total Dam inflow: 420,000ML (excluding forecast); 662,000ML (including forecast). Estimated peak flow at Lowood excluding Wivenhoe Dam releases: 530m³/s (excluding forecast); 530m³/s (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: 770m³/s (excluding forecast); 940m³/s (including forecast). <u>This first peak was estimated to have occurred at 05:00 on 8 Jan 2011.</u> Estimated peak Wivenhoe Dam outflow: 1,480m³/s (excluding forecast); 1,540m³/s (including forecast). This flow was significantly greater than the calculated natural peak that excluded Wivenhoe Dam releases. 	<p>Strategy W3 and Strategy S2 (Lake level greater than 68.50m, maximum release 4,000m³/s)</p> <ul style="list-style-type: none"> Inflows from Lockyer Creek into the Brisbane River had inundated all bridges downstream of the Dam, with the exception of the Mt Crosby Weir Bridge and Fernvale Bridge. The strategy transitioned from W1 to W3 as it became apparent Wivenhoe Dam level was likely to exceed 68.5m and Strategy W2 couldn't be applied. Strategy W3 required the flow at Moggill to be lowered to 4,000m³/s as soon as possible after the naturally occurring peak at Moggill (excluding Wivenhoe Dam releases). This was already achieved. Strategy W3 also required lower level Manual objectives to be considered. Therefore consideration was given to minimising disruption to downstream rural life and endeavouring to keep Mt Crosby Weir Bridge and Fernvale Bridge trafficable. There was also awareness Wivenhoe Dam outflows were already more than doubling the natural peak flow at Moggill. Due to rainfall on the ground, it was apparent the Somerset Dam level would exceed 100.45m. Accordingly, two sluice gates were opened during this period to allow Dam levels to move towards the Operating Target Line in accordance with Strategy S2.

2 FLOOD EVENT SUMMARY (continued)

January 2011 Flood Event – Period 5 of 20

Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Saturday 08 Jan 2011 14:00</p> <p>Completed Sunday 09 Jan 2011 01:00</p>	<p>Strategy W3 and Strategy S2</p> <ul style="list-style-type: none"> Releases maintained from both Wivenhoe and Somerset Dams to ensure Mt Crosby Weir Bridge and Fernvale Bridge remained trafficable. No change to gate settings over this period. Wivenhoe Dam discharge was 1,240m³/s. All rural bridges below the Dam, with the exception of the Mt Crosby Weir Bridge and Fernvale Bridge, were flooded. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 100mm; Somerset Dam 111mm; Lockyer Creek 75mm; Bremer River 75mm. <p>Wivenhoe Dam level rose very slightly from 68.61m to 68.63m over the 13-hour period.</p> <p>Somerset Dam level fell from 100.44m to 100.32m over the 13-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 8mm; Somerset Dam 16mm; Lockyer Creek 3mm; Bremer River 3mm. Forecasted 24-hour catchment average rainfall at 16:00 on 8 Jan 2011 was 40mm. Estimated peak Wivenhoe Dam level: 68.7m (excluding forecast); 68.9m (including forecast). Estimated peak Somerset Dam level: 100.5m (excluding forecast); 100.6m (including forecast). Estimated total Dam inflow: 457,000ML (excluding forecast); 697,000ML (including forecast). Estimated peak flow at Lowood excluding Wivenhoe Dam releases: 530m³/s (excluding forecast); 530m³/s (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: 770m³/s (excluding forecast); 840m³/s (including forecast). This first peak was estimated to have occurred at 05:00 on 8 Jan 2011. Estimated peak Wivenhoe Dam outflow: 1,480m³/s (excluding forecast); 1,520m³/s (including forecast). This flow was significantly greater than the calculated natural peak that excluded Wivenhoe Dam releases. 	<p>Strategy W3 and Strategy S2 (Lake level greater than 68.50m, maximum release 4,000m³/s)</p> <ul style="list-style-type: none"> Strategy W3 required the flow at Moggill to be lowered to 4,000m³/s as soon as possible after the naturally occurring peak at Moggill (excluding Wivenhoe Dam releases). This was already achieved. Strategy W3 also required lower level Manual objectives to be considered. Therefore, with lake levels rising slightly (Wivenhoe Dam) and falling (Somerset Dam) consideration during this period remained on minimising disruption to downstream rural life and endeavouring to keep Mt Crosby Weir Bridge and Fernvale Bridge trafficable. <u>Wivenhoe Dam outflows were more than doubling the natural peak flows at Moggill. Increasing releases from Wivenhoe Dam to produce a flow rate at Moggill of up to 3,000m³/s would have meant transitioning back to operating Strategy W1 in around 18 hours from this time. Therefore, increasing Dam releases could not be justified given the resulting impacts such a flow would have downstream, especially on localised flooding in Brisbane.</u> With the Somerset Dam level still expected to exceed 100.45m, and the level in Wivenhoe Dam remaining relatively static, releases from Somerset Dam continued. Closing of the sluices would have resulted in Dam levels quickly moving under the Operating Target Line requiring sluice re-opening within a short period.

2 FLOOD EVENT SUMMARY (continued)

January 2011 Flood Event – Period 7 of 20

Date/time	Background	Dam conditions	Rainfall and model results	Strategy
Commenced Sunday 09 Jan 2011 08:00	<p>Strategy W3 and Strategy S2 Wivenhoe Directives #7. Somerset Directives #4 to #5.</p> <ul style="list-style-type: none"> Releases increased marginally from Wivenhoe Dam to account for the passing of the Lockyer Creek peak while ensuring Mt Crosby Weir Bridge and Fernvale Bridge remained trafficable. Wivenhoe Dam discharge increased from 1,334m³/s to 1,386m³/s. Somerset Dam sluice gates opened progressively over this period to allow Dam levels to move towards the Operating Target Line in accordance with Strategy S2. All rural bridges below the Dam, with the exception of the Mt Crosby Weir Bridge and Fernvale Bridge, were flooded. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 146mm; Somerset Dam 199mm; Lockyer Creek 94mm; Bremer River 90mm. <p>Wivenhoe Dam level rose very slightly from 68.56m to 68.58m over the six-hour period.</p> <p>Somerset Dam level rose from 100.28m to 100.47m over the six-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 34mm; Somerset Dam 53mm; Lockyer Creek 18mm; Bremer River 15mm. Forecast 24-hour catchment average rainfall at 10:00 on 9 Jan 2011 was 50mm. Estimated peak Wivenhoe Dam level: 70.0m (excluding forecast); 71.3m (including forecast). Estimated peak Somerset Dam level: 100.7m (excluding forecast); 101.1m (including forecast). Estimated total Dam inflow: 804,000ML (excluding forecast); 1,108,000ML (including forecast). Estimated peak flow at Lowood excluding Wivenhoe Dam releases: 530m³/s (excluding forecast); 690m³/s (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: 770m³/s (excluding forecast); 1,210m³/s (including forecast). This first peak was estimated to have occurred at 05:00 on 8 Jan 2011. Estimated peak Wivenhoe Dam outflow: 1,490m³/s (excluding forecast); 1,560m³/s (including forecast). This flow was significantly greater than the calculated natural peak that excluded Wivenhoe Dam releases. 	<p>Strategy W3 and Strategy S2 (Lake level greater than 68.50m, maximum release 4,000m³/s).</p> <ul style="list-style-type: none"> At 11:00, using the BoM rainfall forecasts, an assessment (see Appendix K) showed the lower limit of three day forecast inflow to be similar to the October 2010 flood event, with the upper limit similar to the February 1999 flood event. This assessment supported consideration remaining on minimising disruption to downstream rural life and endeavouring to keep Mt Crosby Weir Bridge and Fernvale Bridge trafficable as this was the approach used during both the October 2010 the February 1999 flood events. However by 14:00, it was noted that the estimated total Dam inflow of 1,108,000ML (including forecast) – had never previously been exceeded on a full dam, with the previous largest volumes being 870,000ML in April 1989 and 925,000 in February 1999. Although the inflow estimate of 1,108,000ML was based on a forecast, it resulted in an expectation that if rainfall continued there may be a need within the next six hours to transition to a situation where minimising disruption to downstream rural life was no longer considered. This would result in the closure of all bridges between the Dam and Moggill, the closure of the Brisbane Valley Highway and the further isolation of rural communities. With Dam levels under the Operating Target Line at the end of this period, releases continued from Somerset Dam.
Completed Sunday 09 Jan 2011 14:00				

2 FLOOD EVENT SUMMARY (continued)

January 2011 Flood Event – Period 8 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Sunday 09 Jan 2011 14:00</p> <p>Completed Sunday 09 Jan 2011 19:00</p>	<p>Strategy W3 and Strategy S2</p> <ul style="list-style-type: none"> During this period, releases continued from both Dams at a level that ensured Mt Crosby Weir Bridge and Fernvale Bridge remained trafficable. Gate settings were unchanged and the Wivenhoe Dam discharge was 1,411m³/s. Due to rainfall on the ground and the modelled rapid lake level rises, a decision was made to focus on protecting urban areas from inundation at 19:00. Councils, the Dam Safety Regulator and Seqwater's CEO were notified of the decision soon after 19:00. The ramifications of the decision were that the new estimated peak flow at Moggill of 3,300m³/s would impact properties and begin to damage urban areas below Moggill. Brisbane City Council damage tables indicated at flows of 3,000m³/s, damage costs would exceed \$5.0 million and 2,600 properties would be impacted in some way. The level of impact would increase significantly as flows increased and therefore the focus was on minimising the flow at Moggill. A decision was made at 19:00, to staff the Flood Operations Centre with at least two Duty Engineers at all times until the peak of the Event had occurred. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 208mm; Somerset Dam 305mm; Lockyer Creek 116mm; Bremer River 96mm. <p>Wivenhoe Dam level rose from 68.58m to 68.97m over the five-hour period.</p> <p>Somerset Dam level rose from 100.47m to 101.43m over the five-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 62mm; Somerset Dam 106mm; Lockyer Creek 22mm; Bremer River 6mm. Forecast 24-hour catchment average rainfall at 16:00 on 9 Jan 2011 was 65mm. Estimated peak Wivenhoe Dam level: 72.1m (excluding forecast); 73.9m (including forecast). Estimated peak Somerset Dam level: 102.3m (excluding forecast); 103.0m (including forecast). Estimated total Dam inflow: 1,272,000ML (excluding forecast); 1,712,000ML (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: 770m³/s (excluding forecast); 1,940m³/s (including forecast). This <u>first</u> peak was estimated to have occurred at 05:00 on 8 Jan 2011. Estimated peak flow at Moggill including Wivenhoe Dam releases: 3,300m³/s (excluding forecast); 4,400m³/s (including forecast). 	<p>Strategy W3 and Strategy S2 (Lake level greater than 68.50m, maximum release 4,000m³/s)</p> <ul style="list-style-type: none"> Lake levels were <u>starting to rise quickly at both dams</u>, and combined with heavy rain in the Dam catchments during this period, it was decided at the end of the period to no longer consider minimising disruption to downstream rural life and to focus only on protecting urban areas from inundation. Towards the end of this period, it <u>also</u> became apparent Moggill was likely to experience a second naturally occurring peak on 10 Jan 2011 or later. The Manual required the flow at Moggill to be minimised prior to this peak occurring. This requirement competed with the need to protect urban areas by not allowing the Wivenhoe Dam to reach a level that invoked Strategy W4. It was decided the best course of action was to increase releases as quickly as possible to the limit of non-damaging flows at Moggill. However, before this could occur, Councils needed to be advised, bridges needed to be closed and actions needed to be taken to prepare rural communities for isolation and urban areas below Moggill for river flows approaching 3,500m³/s. With Dam levels under the Operating Target Line during this period, releases continued from Somerset Dam.

Deleted: continuing to rise at both Dams

2 FLOOD EVENT SUMMARY (continued)

January 2011 Flood Event – Period 9 of 20

Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Sunday 09 Jan 2011 19:00</p> <p>Completed Monday 10 Jan 2011 01:00</p>	<p>Strategy W3 and Strategy S2</p> <ul style="list-style-type: none"> Agency notifications commenced at 19:00. Brisbane City Council, the Dam Safety Regulator and Seqwater's CEO were advised the likely peak flow at Moggill would exceed 3,000m³/s. Brisbane City Council damage tables indicated, at flows of 3,000m³/s, damage costs would exceed \$5.0 million and 2,600 properties would be impacted in some way. The level of impact would increase significantly as flows increased, and therefore the focus was on minimising the flow at Moggill. Fernvale Bridge was closed by police at around 01:00 on 10 Jan 2011. A directive was issued to increase releases from Wivenhoe Dam. Gate settings did not change over this period due to the potential danger to the public associated with inundating Fernvale Bridge from Wivenhoe Dam outflows prior to the bridge being closed to traffic. Councils also required time to prepare for the isolation of rural communities, the onset of urban damage below Moggill and to undertake any necessary evacuations. Wivenhoe Dam discharge was 1,473m³/s. All rural bridges below the Dam, with the exception of Mt Crosby Weir Bridge and Fernvale Bridge, were flooded. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 232mm; Somerset Dam 343mm; Lockyer Creek 131mm; Bremer River 102mm. <p>Wivenhoe Dam level rose from 68.97m to 69.9m over the six-hour period.</p> <p>Somerset Dam level rose from 101.43m to 102.54m over the six-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 24mm; Somerset Dam 38mm; Lockyer Creek 15mm; Bremer River 6mm. Forecast 24-hour catchment average rainfall at 16:00 on 9 Jan 2011 was 65mm. Estimated peak Wivenhoe Dam level: <ul style="list-style-type: none"> 72.9m (excluding forecast); 74.7m (including forecast). Estimated peak Somerset Dam level: <ul style="list-style-type: none"> 102.9m (excluding forecast); 103.4m (including forecast). Estimated total Dam inflow: <ul style="list-style-type: none"> 1,468,000ML (excluding forecast); 1,922,000ML (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: <ul style="list-style-type: none"> 820m³/s (excluding forecast); 2,000m³/s (including forecast). This second peak was estimated to occur at 16:00 on 10 Jan 2011. Estimated peak flow at Moggill including Wivenhoe Dam releases: <ul style="list-style-type: none"> 3,240m³/s (excluding forecast); 4,480m³/s (including forecast). 	<p>Strategy W3 and Strategy S2 (Lake level greater than 68.50m, maximum release 4,000m³/s)</p> <ul style="list-style-type: none"> Consideration now focused on protecting urban areas from inundation. However, before releases were increased to and above the limit of non-damaging floods at Moggill, Councils and other impacted agencies were notified so appropriate actions could be taken, including any necessary evacuations and the closure of the Mt Crosby Weir Bridge and Fernvale Bridge. The Manual requires the flow at Moggill to be minimised prior to its naturally occurring peak. This requirement was balanced against the need to protect urban areas by releasing water from the Dams in an attempt to keep the Wivenhoe Dam lake below a level that would invoke Strategy W4. Based on an estimated 16 hour travel time between the Dam and Moggill, this did occur. With Dam levels under the Operating Target Line during this period, releases continued from Somerset Dam. Although there was a full awareness of the rainfall forecasts and associated potential flood impacts, the strategy was not to release flows that would cause high level urban inundation until it was certain it could not be avoided. Model results continued to indicate this may be possible.

2 FLOOD EVENT SUMMARY (continued)

January 2011 Flood Event – Period 10 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Monday 10 Jan 2011 01:00</p> <p>Completed Monday 10 Jan 2011 09:00</p>	<p>Strategy W3 and Strategy S2 Wivenhoe Directives #8 to #10.</p> <ul style="list-style-type: none"> Gates opened continuously at Wivenhoe Dam for eight hours in accordance with standard gate opening sequence at a rate of 0.5m of individual gate opening per hour. Wivenhoe Dam discharge increased from 1,473m³/s to 2,015m³/s. All rural bridges below the Dam were flooded. Further gate openings at Wivenhoe Dam were paused at 09:00 in an attempt to allow the Lockyer Creek and Bremer River peaks to pass Moggill, and to restrict Brisbane River flows at Moggill to 3,500m³/s. This was achieved following discussions with Brisbane City Council that advised a flow of 3,500m³/s at Moggill would fully submerge 322 properties and impact 7,000 properties. No gate movements occurred at Somerset Dam during this period, with Dam levels plotting under the Operating Target Line. This meant the only gate movements allowable at Somerset Dam under Strategy S2 would be openings and this did not happen to limit further rises in Wivenhoe Dam. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 244mm; Somerset Dam 373mm; Lockyer Creek 143mm; Bremer River 120mm. <p>Wivenhoe Dam level rose from 69.97m to 71.56m over the eight-hour period.</p> <p>Somerset Dam level rose from 102.54m to 103.08m over the eight-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 12mm; Somerset Dam 30mm; Lockyer Creek 12mm; Bremer River 18mm. Forecast 24 hour catchment average rainfall at 16:00 on 9 Jan 2011 was 65mm. Estimated peak Wivenhoe Dam level: <ul style="list-style-type: none"> 72.9m (excluding forecast); 74.5m (including forecast). Estimated peak Somerset Dam level: <ul style="list-style-type: none"> 103.1m (excluding forecast); 103.5m (including forecast). Estimated total Dam inflow: <ul style="list-style-type: none"> 1,531,000ML (excluding forecast); 1,985,000ML (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: <ul style="list-style-type: none"> 1,090m³/s (excluding forecast); 2,090m³/s (including forecast). This second peak was estimated to occur at 16:00 on 10 Jan 2011. Estimated peak flow at Moggill including Wivenhoe releases: <ul style="list-style-type: none"> 3,420m³/s (excluding forecast); 4,680m³/s (including forecast). 	<p>Strategy W3 and Strategy S2 (Lake level greater than 68.50m, maximum release 4,000m³/s)</p> <ul style="list-style-type: none"> Consideration was given to protecting urban areas from inundation and minimising urban damage. Due to advice received from Brisbane City Council that a flow of 3,500m³/s at Moggill would fully submerge 322 properties and impact 7,000 properties, an attempt was made to remain below this flow level. The approach in the Manual which states the intent of Strategy W3 is to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s, was adopted. Advice received from Brisbane City Council that the upper limit of non-damaging floods was below the 4,000m³/s stated in the Manual was noted and taken into account in the decision making processes. With Dam levels under the Operating Target Line during this period, releases continued from Somerset Dam. Although there was full awareness of the rainfall forecasts and associated potential flood impacts, the strategy was not to release flows that would cause high level urban inundation until it was certain it could not be avoided. Model results continued to indicate this may be possible.

2 FLOOD EVENT SUMMARY (continued)

January 2011 Flood Event – Period 11 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Monday 10 Jan 2011 09:00</p> <p>Completed Monday 10 Jan 2011 15:00</p>	<p>Strategy W3 and Strategy S2</p> <ul style="list-style-type: none"> Gate settings at Wivenhoe Dam did not change over this period. Wivenhoe Dam discharge was 2,087m³/s. All rural bridges below the Dam were flooded. At 15:00, the attempt to restrict Brisbane River flows at Moggill to 3,500m³/s was abandoned due to rainfall in the Dam catchments. A new target of 4,000m³/s was set in accordance with the Manual, on the basis that Strategy W3 intends to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s and minimise urban damage. Gate movements at Somerset Dam did not change during this period, with Dam levels plotting under the Operating Target Line. This meant the only gate movements allowable at Somerset Dam under Strategy S2 was openings and this was not done to limit further rises in Wivenhoe Dam. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 274mm; Somerset Dam 407mm; Lockyer Creek 169mm; Bremer River 149mm. <p>Wivenhoe Dam level rose from 71.56m to 72.54m over the six-hour period.</p> <p>Somerset Dam level rose from 103.08m to 103.43m over the six-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 30mm; Somerset Dam 34mm; Lockyer Creek 27mm; Bremer River 29mm. 2 FLOOD EVENT SUMMARY (continued)

January 2011 Flood Event – Period 12 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Monday 10 Jan 2011 15:00</p> <p>Completed Monday 10 Jan 2011 20:00</p>	<p>Strategy W3 and Strategy S2 Wivenhoe Directive #11.</p> <ul style="list-style-type: none"> Gates opened continuously at Wivenhoe Dam for five hours in line with standard gate opening sequence, at a rate of 1.0m of individual gate opening per hour. Wivenhoe discharge increased from 2,087m³/s to 2,695m³/s. In accordance with the Manual, a target of 4,000m³/s at Moggill was set, on the basis of the intent of Strategy W3 to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s and minimise urban damage. Further gate openings at Wivenhoe Dam were paused at 20:00 in an attempt to allow the Lockyer Creek and Bremer River peaks to pass Moggill and to restrict Brisbane River flows at Moggill to 4,000m³/s. No gate movements occurred at Somerset Dam during this period, with Dam levels plotting under the Operating Target Line. This limited further rises in Wivenhoe. Initial advice on a major flash flood originating in the Lockyer headwaters was received from BoM at 17:32. No volume or flow details were available and gauges in the area were not indicating a significant event. The event would not impact on the Brisbane River for 24 hours. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 279mm; Somerset Dam 415mm; Lockyer Creek 174mm; Bremer River 153mm. <p>Wivenhoe Dam level rose from 72.53m to 73.06m over the five-hour period.</p> <p>Somerset Dam level rose from 103.43m to 103.45m over the five-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 5mm; Somerset Dam 8mm; Lockyer Creek 5mm; Bremer River 4mm. Forecast 24-hour catchment average rainfall at 16:00 on 10 Jan 2011 was 38mm. Estimated peak Wivenhoe level: 73.6m (excluding forecast); 74.3m (including forecast). Estimated peak Somerset level: 103.5m (excluding forecast); 103.5m (including forecast). Estimated total Dam inflow: 1,731,000ML (excluding forecast); 1,982,000ML (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: 1,500m³/s (excluding forecast); 1,840m³/s (including forecast). This second peak was estimated to occur at 20:00 on 10 Jan 2011. Estimated peak flow at Moggill including Wivenhoe Dam releases: 3,980m³/s (excluding forecast); 4,470m³/s (including forecast). The extreme rainfall that occurred in Lockyer Creek catchment during this period was not recorded in the remotely-accessible rain gauges in the catchment, and was not indicated on the BoM weather radar. 	<p>Strategy W3 and Strategy S2 (Lake level greater than 68.50m, maximum release 4,000m³/s)</p> <ul style="list-style-type: none"> Consideration focused on protecting urban areas from inundation and minimising urban damage. The target maximum flow at Moggill was now 4,000m³/s. The approach in the Manual which states the intent of Strategy W3 is to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s, continued to be followed. With Dam levels under the Operating Target Line during this period, Somerset Dam releases continued. The reduced rainfall forecast justified retaining the target of 4,000m³/s at Moggill, while the Wivenhoe Dam peak of 74.3m (including forecast) indicated it may be possible to keep urban damage within tolerable limits. A discussion was held with the Dam Safety Regulator to request permission to exceed a level of 74.0m in Wivenhoe Dam for a short period (maximum 12 hours) without invoking Strategy W4, if the safety of the Dam could be guaranteed and urban damage reduced. The Regulator agreed with this approach and provided permission. The strategy continued to not release flows that would cause high level urban inundation until it was certain it could not be avoided. Model results continued to indicate this may be possible.

2 FLOOD EVENT SUMMARY (continued)

January 2011 Flood Event – Period 13 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Monday 10 Jan 2011 20:00</p> <p>Completed Tuesday 11 Jan 2011 04:00</p>	<p>Strategy W3 and Strategy S2</p> <ul style="list-style-type: none"> Gate openings at Wivenhoe Dam were paused at 20:00 in an attempt to restrict flows at Moggill to close to 4,000m³/s. There were no changes to gate settings at Wivenhoe Dam over this period. The Dam discharge was 2,726m³/s. In accordance with the Manual, a target flow of 4,000m³/s at Moggill was set on the basis of Strategy W3 to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s. However, Brisbane City Council damage tables indicated this would still impact 5,325 properties and cause damage exceeding \$47.0 million. At 17:32, initial advice was provided about a significant flash flood originating in the Lockyer Creek headwaters. Details were received at 20:00. The focus was on developing strategies to manage these potential flows, however, as any strategy would involve significantly reducing outflows from Wivenhoe Dam, the strategies were not adopted. During this period the plotted dam levels drifted just above the Operating Target Line. This led to a decision at 04:00 to start closing down releases from Somerset Dam to limit further rises in Wivenhoe Dam. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 323mm; Somerset Dam 437mm; Lockyer Creek 186mm; Bremer River 167mm. <p>Wivenhoe Dam level rose from 73.06m to 73.40m over the eight-hour period.</p> <p>Somerset Dam level fell from 103.45m to 103.23m over the eight-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 44mm; Somerset Dam 22mm; Lockyer Creek 12mm; Bremer River 14mm. Forecast 24-hour catchment average rainfall at 18:00 on 10 Jan 2011 was 38mm. Estimated peak Wivenhoe level: 74.1m (excluding forecast); 74.9m (including forecast). Estimated peak Somerset level: 103.5m (excluding forecast); 103.7m (including forecast). Estimated total dam inflow: 2,016,000ML (excluding forecast); 2,267,000ML (including forecast). Estimated peak flow at Moggill excluding Wivenhoe Dam releases: 1,500m³/s (excluding forecast); 1,810m³/s (including forecast). This <u>second</u> peak was estimated to have occurred at 20:00 on 10 Jan 2011. Estimated peak flow at Moggill including Wivenhoe Dam releases: 4,040m³/s (excluding forecast); 4,540m³/s (including forecast). 	<p>Strategy W3 and Strategy S2 (Lake level greater than 68.50m, maximum release 4,000m³/s)</p> <ul style="list-style-type: none"> Consideration focused on protecting urban areas from inundation and minimising urban damage. The target maximum flow at Moggill remained 4,000m³/s. The approach in the Manual which states the intent of Strategy W3 is to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s, continued to be followed. Model results showed a peak level in the Dam close to 74.0m was possible, but appeared increasing unlikely. With Dam levels moving above the Operating Target Line during this period, it was decided to begin closing down releases from Somerset Dam to limit further rises in Wivenhoe Dam. Although there was full awareness of the rainfall forecasts and associated potential flood impacts, the strategy was not to release flows that would cause high level urban inundation until it was certain it could not be avoided. Model results continued to indicate this may be possible however, as rainfall continued, the strategy was reviewed each hour. At 21:00 the Dam Safety Regulator was asked for permission to exceed a level of 74.0m in Wivenhoe Dam for a short period (maximum 12 hours) without invoking Strategy W4, provided the safety of the Dam could be guaranteed. This was considered carefully during the period in view of the continued rainfall.

2 FLOOD EVENT SUMMARY (continued)

January 2011 Flood Event – Period 14 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
Commenced Tuesday 11 Jan 2011 04:00	<p>Transition from Strategy W3 to Strategy W4; and Strategy S2 Wivenhoe Directive #12. Somerset Directive #6.</p>	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 33mm; Wivenhoe Dam (local) 78mm; Somerset Dam 46mm; Lockyer Creek 54mm; Bremer River 16mm. 	<p>Strategy W4 and Strategy S2 (Lake level predicted to exceed 74.00m, no maximum release rate)</p> <ul style="list-style-type: none"> At 08:00, model results showed restricting the peak level in the Dam close to 74.0m was no longer possible due to the high intensity rainfall experienced over this period.
Completed Tuesday 11 Jan 2011 08:00	<ul style="list-style-type: none"> Extreme intense rainfall (estimated after the Event to possibly exceed 1 in 2000 year intensities) commenced on and close to the Wivenhoe Dam lake area during this period. If the centroid of this rainfall was located further east or south, it may have been possible to avoid transition to Strategy W4. Because the extreme intense rainfall was occurring on and close to the Dam rather than in the northern areas of the Dam catchment, response time was minimised and quick action was needed to protect the safety of the Dam. Accordingly, at 08:00, a decision was made to transition to Strategy W4. Significant urban damage was not to be avoided and the Dam Safety Regulator, Seqwater's CEO and the Councils were advised. Gate settings were not changed at Wivenhoe Dam over this period. Wivenhoe Dam discharge was 2,832m³/s. Sluice gate openings at Somerset Dam were reduced from five to two as the plotted dam levels had drifted just above the Operating Target Line. 	<ul style="list-style-type: none"> Wivenhoe Dam 356mm; Somerset Dam 483mm; Lockyer Creek 240mm; Bremer River 183mm. <p>Wivenhoe Dam level rose from 73.40m to 73.70m over the four-hour period.</p> <p>Somerset Dam level rose from 103.23m to 103.46m over the four-hour period.</p>	<ul style="list-style-type: none"> Forecast 24-hour catchment average rainfall at 16:00 on 10 Jan 2011 was 38mm. Estimated peak Wivenhoe level: 74.5m (excluding forecast); 75.1m (including forecast). Estimated peak Somerset Dam level: 103.9m (excluding forecast); 104.2m (including forecast). Estimated total Dam inflow: 2,210,000ML (excluding forecast); 2,460,000ML (including forecast). Estimated peak flow at Moggill including Wivenhoe Dam releases: 5,870m³/s (excluding forecast). 	<ul style="list-style-type: none"> At 08:00 it was decided to transition to Strategy W4 and the Dam Safety Regulator, Seqwater's CEO and Councils were advised. It was now apparent significant urban damage resulting from releases from Wivenhoe Dam could not be avoided due to the extreme intense rainfall (estimated after the Event to exceed 1 in 500 year intensities) that commenced on and close to the Wivenhoe Dam lake area during this period. As Dam levels moved above the Operating Target Line during this period, releases from Somerset Dam were progressively closed down to limit further rises in Wivenhoe Dam (sluices were closed down at hourly intervals in accordance with the Manual).

2 FLOOD EVENT SUMMARY (continued)

January 2011 Flood Event – Period 15 of 20

Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Tuesday 11 Jan 2011 08:00</p> <p>Completed Tuesday 11 Jan 2011 13:00</p>	<p>Strategy W4 and Strategy S2 Wivenhoe Directive #12 to #14. Somerset Directive #7.</p> <ul style="list-style-type: none"> Extreme intense rainfall (estimated after the Event to exceed 1 in 500 year intensities) continued on and close to the Wivenhoe Dam lake area during this period. If the centroid of this rainfall was located further east or south, it may have been possible to avoid transition to Strategy W4. Because the extreme intense rainfall was occurring on and close to the Dam rather than in the northern areas of the Dam catchment, response time was minimised and quick action was needed to protect the safety of the Dam. Once Strategy W4 is invoked, the Manual requires the opening of gates in accordance with standard sequences until the storage level of Wivenhoe Dam begins to fall. Accordingly gates were opened continuously at Wivenhoe Dam for five hours in accordance with the standard gate opening sequence at an average rate of 2.0m of opening per hour. This increased the Dam discharge from 2,753m³/s to 4,250m³/s. The threshold limit for urban damage had been exceeded and the lake level continued to rise. During this period Somerset Dam sluice gate openings were closed to limit rises in Wivenhoe Dam in accordance with Strategy S2. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 382mm; Somerset Dam 570mm; Lockyer Creek 287mm; Bremer River 237mm. <p>Wivenhoe Dam level rose from 73.70m to 74.39m over the five-hour period.</p> <p>Somerset Dam level rose from 103.46m to 103.83m over the five-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 26mm; Wivenhoe Dam (local) 85mm; Somerset Dam 87mm; Lockyer Creek 47mm; Bremer River 52mm. Forecast 24-hour catchment average rainfall at 10:00 on 11 Jan 2011 was 100mm. A portion of the extreme intense rainfall in the Dam catchment fell in an un-gauged area (e.g. on the lake area) making it difficult for the model to accurately predict lake level rises. Accordingly, operations at Wivenhoe Dam commenced gauge board readings every 30 minutes during this period and relayed this information to the Flood Operations Centre by telephone. Estimated peak Wivenhoe Dam level: <ul style="list-style-type: none"> 75.0m (excluding forecast); 76.2m (including forecast). Estimated peak Somerset Dam level: <ul style="list-style-type: none"> 104.8m (excluding forecast); 105.7m (including forecast). Estimated total Dam inflow is: <ul style="list-style-type: none"> 2,506,000ML (excluding forecast); 3,123,000ML (including forecast). 	<p>Strategy W4 and Strategy S2 (Lake level predicted to exceed 74.00m, no maximum release rate)</p> <ul style="list-style-type: none"> The strategy was to protect the structural safety of the Dam. The Manual requires actions under Strategy W4 to ensure Wivenhoe Dam gate openings occur in accordance with standard sequences until the storage level of Wivenhoe Dam begins to fall. The Dam level continued to rise at 13:00. During this period, a Dam Operator relayed Wivenhoe Dam gauge board readings to the Flood Operations Centre every 30 minutes. All four Duty Engineers were present in the Flood Operations Centre and flood operations decisions were made every half hour upon receipt of the gauge board readings. With Dam levels above the Operating Target Line during this period, releases from Somerset Dam were closed down (all sluices closed at 10:00) to limit further rises in Wivenhoe Dam.

2 FLOOD EVENT SUMMARY (continued)

January 2011 Flood Event – Period 16 of 20				
Date/time	Background	Dam conditions	Rainfall and model results	Strategy
<p>Commenced Tuesday 11 Jan 2011 13:00</p> <p>Completed Tuesday 11 Jan 2011 19:00</p>	<p>Strategy W4 and Strategy S2 Wivenhoe Directive #12 to #14.</p> <ul style="list-style-type: none"> Extreme rapid lake level rises in Wivenhoe Dam continued during this period. The QPF issued at 16:00 was for a catchment average rainfall of 75mm over the next 24 hours. Gates were opened continuously at Wivenhoe Dam for six hours in accordance with Strategy W4 and the standard gate opening sequence at an average rate of 4.5m of individual gate opening per hour. Wivenhoe Dam discharge was increased from 4,250m³/s to 7,464m³/s. Significant damage to urban areas below Moggill could not be avoided. Estimated peak inflow during this period exceeded 12,000m³/s. No sluice releases were made from Somerset Dam to limit increases in Wivenhoe Dam in accordance with Strategy S2. 	<p>Total rainfall from 08:00 on 6 Jan 2011 to the end of this period:</p> <ul style="list-style-type: none"> Wivenhoe Dam 397mm; Somerset Dam 610mm; Lockyer Creek 325mm; Bremer River 278mm. <p>Wivenhoe Dam level rose from 74.39m to 74.97m over the six-hour period.</p> <p>Somerset Dam level rose from 103.83m to 104.60m over the six-hour period.</p>	<ul style="list-style-type: none"> Catchment average rainfalls during this period were: <ul style="list-style-type: none"> Wivenhoe Dam 15mm; Wivenhoe Dam (local) 35mm; Somerset Dam 40mm; Lockyer Creek 38mm; Bremer River 41mm. Forecast 24-hour catchment average rainfall at 16:00 on 11 Jan 2011 was 75mm. However, catchment average rainfalls totals this period were: <ul style="list-style-type: none"> Wivenhoe Dam 8mm; Wivenhoe Dam (local) 13mm; Somerset Dam 19mm; Lockyer Creek 9mm; Bremer River 8mm. <p>A portion of the extremely intense rainfall in the Dam catchment fell in an un-gauged area (e.g. on the dam lake area) making it difficult for the model to accurately predict lake level rises.</p> <ul style="list-style-type: none"> Estimated peak Wivenhoe Dam level: 75.0m (excluding forecast); 75.2m (including forecast). Estimated peak Somerset Dam level: 105.2m (excluding forecast); 105.9m (including forecast). Estimated total dam inflow: 2,659,000ML (excluding forecast); 3,289,000ML (including forecast). 	<p>Strategy W4 and Strategy S2 (Lake level predicted to exceed 74.00m, no maximum release rate)</p> <ul style="list-style-type: none"> The strategy was to protect the structural safety of the Dam. The Manual requires actions under Strategy W4 to ensure Wivenhoe Dam gate openings occur in accordance with standard sequences until the storage level of Wivenhoe Dam begins to fall. The lake level in both Dams continued to rise during this period. A Dam operator relayed Wivenhoe Dam gauge board readings to the Flood Operations Centre every 30 minutes. All four Duty Engineers were present in the Flood Operations Centre and decisions were made every half hour upon receipt of the gauge board readings. With Dam levels above the Operating Target Line during this period no sluice releases were made from Somerset Dam to limit further rises in Wivenhoe Dam. The water level in Wivenhoe Dam peaked at 19:00 on 11 Jan 2011 at 74.97m.

3 EVENT MOBILISATION AND STAFFING

3.1 Catchment conditions at Event commencement

In addition to the two floods occurring during the 2011 Flood Event, in the 25 days leading up to the January 2011 Flood Event, three separate flood events impacted Somerset and Wivenhoe Dams. Flood releases were made from Wivenhoe Dam on all but five of those days. The total outflow from the three additional events was around 690,000ML and the details of these events are outlined in Table 3.1.1 following:

Event	Event start date	Event end date	Volume released (ML)
1	13/12/2010	16/12/2010	70,000
2	17/12/2010	24/12/2010	150,000
3	26/12/2010	02/01/2011	470,000

Table 3.1.1 – Outflow from three separate flood events, commencing December 2010

During these events, requests were received from Councils and residents, either isolated or adversely impacted by bridge closures downstream of the Dam, to curtail releases as soon and as quickly as possible. This was a significant issue at the time, because bridge closures had occurred over the traditional Christmas/New Year holiday period, including closures on Christmas and New Year's Day. However, releases during these events were always made in accordance with the Manual.

Less than four days separated the end date of Event 3 and the commencement of the January 2011 Flood Event. Due to the rainfall that had occurred in the Dam catchments throughout December 2010, at the start of the January 2011 Flood Event, the catchment conditions were near saturation. The catchment was highly responsive, with the initial loss varying between 0 and 30mm. Continuing loss rates were also unusually low. Because the degree of catchment saturation increased as the Event progressed, very high levels of run-off generation were experienced throughout the Event.

Deleted: as

Deleted: This meant that any significant drain down of Somerset and Wivenhoe Dams during this period was impossible without causing significant bridge inundation downstream of the Dam and without exceeding minor flood levels in the lower Brisbane River. These actions were also not able to be justified by the Manual, particularly as Section 8.3 states the following in relation to Wivenhoe Dam:¶
 "The spillway gates are not to be opened for flood control purposes prior to the reservoir level exceeding EL 67.25." ¶
 This issue is also discussed in Section 17.0. ¶
 Finally,

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHANGES TO VERIFIED INFORMATION

3.2 Event mobilisation

There was no significant rainfall in the 24 hours to 09:00 on Wednesday 5 January 2011, however, in the 24 hours to 08:00, Thursday 6 January 2011, catchment average rainfall totals were:

- Wivenhoe Dam 28mm;
- Somerset Dam 21mm;
- Lockyer Creek 23mm;
- Bremer River 23mm.

Deleted:
Deleted: on
Deleted:

This rainfall was sufficient to trigger event mobilisation at 07:42, Thursday 6 January 2011, using Strategies W1A and S2. Based on the rainfall at that time and subsequent model runs, the Somerset lake level was forecast to peak at 99.7m (excluding forecast) and 100.0m (including forecast). The Wivenhoe lake level was forecast to peak at 68.3m (excluding forecast) and 68.4m (including forecast).

Deleted: ,
Deleted: which occurred
Deleted: on
Deleted:
Deleted:

The following actions were undertaken as soon as mobilisation occurred:

- 24/7 staffing commenced at the Flood Operations Centre, with at least one Duty Flood Operations Engineer and at least one trained Flood Officer present (minimum two persons);
- 24/7 staffing commenced at the Dams, with at least two trained Dam Operators present;
- The Flood Operations Engineers were called back early from annual leave to assist with the management of the Event.

Deleted:
Deleted: one absent
Deleted: as

Staffing of the Flood Operations Centre and the Dams continued on this basis until event de-mobilisation at 12:00, Wednesday 19 January 2011. During critical periods, all four Flood Operations Engineers were present in the Flood Operations Centre and were actively involved in flood event decision-making processes. These Engineers generally lived in the Flood Operations Centre building during the critical 96 hours of the Event, as did a number of the trained Flood Officers.

3.3 Qualifications of staff on duty

Flood Operations Engineers

The four Flood Operations Engineers approved by the Chief Executive to direct the operations of Somerset and Wivenhoe Dams during flood events are:

- Flood Operations Engineer 1;
- Flood Operations Engineer 2;
- Flood Operations Engineer 3;
- Flood Operations Engineer 4.

Deleted:

All Engineers had demonstrated to the Chief Executive they have:

1. Knowledge of design principles related to the structural, geotechnical and hydraulic design of large dams, and
2. At least a total of five years suitable experience, having demonstrated their expertise in at least two of the following areas:
 - Investigation, design or construction of major dams;
 - Operation and maintenance of major dams;
 - Hydrology with particular reference to flooding, estimation of extreme storms, water management or meteorology;
 - Applied hydrology with particular reference to flood forecasting and/or flood forecasting systems.

Deleted: The approved Engineers all hold a current Certificate of Registration as a Registered Professional Engineer of Queensland, as well as tertiary degrees in engineering.

3 EVENT MOBILISATION AND STAFFING (continued)

Flood Operations Engineers 1, 2 and 3 are three of the most experienced and expert Engineers in the industry, in relation to their knowledge of Brisbane River flood hydrology. Flood Operations Engineer 4 is one of the most experienced Engineers in Queensland in relation to the operation and maintenance of gated dams. The Flood Operations Engineers' resumes are included in Appendix N.

Deleted: e

Deleted: Australia

Formatted: Font color: Red

Formatted: Font: 9 pt

The four current Flood Operations Engineers undertake flood operations duties as an addition to the senior full-time roles they fill within various State Government organisations. These flood operations duties include 24/7 on call duties, 24/7 catchment monitoring during rainfall events and undertaking 12 hour shifts during flood events. **Flood Operations Engineers do not receive any additional payments to undertake these flood operations duties.** This includes requirements to work extended hours on Christmas Day, Boxing Day, New Years Day and other public holidays, as has occurred in recent months. Flood Operations Engineers are also generally responsible for their own travel and meal arrangements when working in the Flood Operations Centre and in some current instances Flood Operations Engineers undertake the role on a purely voluntary basis.

It should also be noted that the Flood Operations Engineers managed flood operations activities at North Pine Dam in conjunction with the January 2011 Flood Event which impacted Somerset Dam and Wivenhoe Dam. Preliminary indications, based on the North Pine Dam Emergency Action Plan, show the flood event impacting North Pine Dam was in the extreme range (AEP greater than 1 in 2,000).

Flood Officers

Nine Flood Officers, trained in Flood Operations Centre duties, assisted in the Flood Operations Centre during the Event.

1. Flood Officer 1;
2. Flood Officer 2;
3. Flood Officer 3;
4. Flood Officer 4;
5. Flood Officer 5;
6. Flood Officer 6;
7. Flood Officer 7;
8. Flood Officer 8;
9. Flood Officer 9.

Deleted:

Dam Operators

Thirteen Dam Operators, trained in Flood Operations Centre duties, operated Somerset and Wivenhoe Dams during the Event.

1. Dam Operator 1;
2. Dam Operator 2;
3. Dam Operator 3;
4. Dam Operator 4;
5. Dam Operator 5;
6. Dam Operator 6;
7. Dam Operator 7;
8. Dam Operator 8;
9. Dam Operator 9;
10. Dam Operator 10;
11. Dam Operator 11;
12. Dam Operator 12;
13. Dam Operator 13.

4 FLOOD EVENT PROCEDURES

4.1 Introduction

Seqwater has prepared a Flood Procedure Manual that assigns responsibilities to Seqwater personnel for flood event preparation, mobilisation and operation, in relation to Seqwater's Dams, including Somerset and Wivenhoe Dams.

Deleted: around

The relationship between the Flood Procedure Manual and *The Manual of Operational Procedures for Flood Mitigation at Wivenhoe Dam and Somerset Dam* (the Manual) is outlined in Figure 4.1.1.

Deleted: SEQWATER
Deleted: FLOOD PROCEDURE MANUAL

Figure 4.1.1 – Relationship between the Flood Procedure Manual and The Manual of Operations Procedures for Flood Mitigation at Wivenhoe Dam and Somerset Dam

The Flood Procedure Manual is an internal document and is registered in Seqwater's internal document control system (Qpulse). Controlled hardcopies are issued to the following personnel:

Agency	Responsible person	Location
Seqwater	Dam and Source Operations Manager	Margaret Street, Brisbane
Seqwater	Principal Hydrologist	Margaret Street, Brisbane
Seqwater	Senior Flood Operations Engineer	Flood Operations Centre, Brisbane
Seqwater	Principal Engineer Dam Safety	Karalee
Seqwater	Operations Coordinator, South	Karalee
Seqwater	Operations Coordinator, North	Landers Shute
Seqwater	Operations Coordinator, Central	Wivenhoe Dam
Seqwater	Storage Supervisor	Wivenhoe Dam
Seqwater	Storage Supervisor	Leslie Harrison Dam
Seqwater	Storage Supervisor	North Pine Dam
Seqwater	Storage Supervisor	Somerset Dam

Deleted: Location

Table 4.1.2 – Allocation of controlled hardcopies of the Seqwater Flood Procedure Manual

The issue date for the current Flood Procedure Manual is January 2010.

4 FLOOD EVENT PROCEDURES (continued)

4.2 Flood Operations Centre preparedness

~~Prior to the January Flood Event, Flood Operations Engineer 2 was designated the Flood Operations Manager, in accordance with the requirements of the Seqwater Flood Procedure Manual. In conjunction with Flood Operations Engineer 1 (a Senior Flood Operations Engineer), Flood Operations Engineer 2 was responsible for the overall management of the Flood Operations Centre leading up to the Event and ensured:~~

- A Flood Operations Engineer and three Flood Officers were on close call at all times, and ready to attend the Flood Operations Centre if called;
- Sufficient Flood Operations Engineers and Flood Officers were available to staff the Flood Operations Centre if a flood event was declared;
- Contact details for Flood Operations Engineers and Flood Officers were up-to-date;
- Current copies of the following documents were available in the Flood Operations Centre:

- ~~The Manual;~~
- Wivenhoe Dam – Emergency Action Plan;
- Somerset Dam – Emergency Action Plan.

• The following facilities were available in the Flood Operations Centre:

- The data collection and modelling systems required to manage flood events at Somerset and Wivenhoe Dams;
- Sufficient stationery and forms;
- Landline telephone, mobile telephone, satellite telephone, Seqwater radio network, facsimile and email communication systems;
- Power systems and back-up power systems required to ensure computer system reliability during the Flood Event.

~~As defined by the Seqwater Flood Procedure Manual, the role and responsibilities of the Flood Operations Manager, are completely separate to the roles and responsibilities of Flood Operations Engineers. However, a single person can hold both roles at any point in time.~~

~~When one of the Flood Operations Engineers is on call, this person is referred to as the Duty Flood Operations Engineer. There is always a single designated Duty Flood Operations Engineer on call 24 hours a day, seven days a week.~~

~~When on call, the Duty Flood Operations Engineer (one of the four Flood Operations Engineers described in Section 3.3) ensured they:~~

- Were contactable at all times by telephone;
- Had constant access to facilities that provided appropriate real-time monitoring of dam and catchment conditions;
- Were able to travel to the Flood Operations Centre in two hours to direct the mobilisation and operation of the Flood Event, without compromising the safety of the Dams or the intent of the Manual;
- As incoming Duty Flood Operations Engineer, organised the handover from the current duty staff;
- As outgoing Duty Flood Operations Engineer, prepared a status summary sheet for Somerset and Wivenhoe Dams;
- Contacted the Flood Operations Manager if any issues arose with the potential to adversely impact the operations of Flood Operations Centre.

~~When on call, the nine Flood Officers (described in Section 3.3) ensured they:~~

- Were contactable at all times by telephone;
- Reported to the Duty Flood Operations Engineer if at any time while being on call they became unfit for duty;
- Were able to travel to the Flood Operations Centre within two hours of being called;

4.3 Flood Operations Centre mobilisation

The Seqwater Flood Procedure Manual requires the Duty Flood Operations Engineer to declare a flood event and mobilise the Flood Operations Centre, if the Duty Flood Operations Engineer considers it likely the FSL of Somerset Dam or Wivenhoe Dam will be exceeded as a result of rainfall occurring in the Dam catchments and flood releases are likely. The Flood Operations Centre is mobilised as soon as a flood event is declared.

Flood Operations Engineer 2 was the Duty Flood Operations Engineer who declared the January 2011 Flood Event by email at 07:42, Thursday 6 January 2011 (see Appendix H).

When the Flood Operations Centre was mobilised, the Duty Flood Operations Engineer ensured the following actions were undertaken:

- Notified the Senior Flood Operations Engineers of the mobilisation;
- Commenced recording significant events in the Event Log;
- Contacted the required Flood Officers to commence duty at the Flood Operations Centre;
- Contacted the Seqwater Operations Coordinator responsible for Somerset Dam and Wivenhoe Dam, and provided instructions to send Dam operations staff to the Dams. The Operations Coordinator was also advised of the expected duration of the Flood Event to allow time to organise suitable staffing arrangements for the duration of the Event;
- Established 09:00 on Sunday 2 January 2011 as the start time for the Event, for the purposes of modelling predictions;
- Established a suitable directory structure within the computer network to manage the Flood Event data;
- Examined and cleaned all rainfall and stream flow data for the Event prior to use in the flood modelling systems;
- Derived inflow hydrographs for:
 - Wivenhoe Dam;
 - Somerset Dam;
 - Lockyer Creek catchment;
 - Bremer River catchment.
- Examined these derived inflow hydrographs across a variety of appropriate rainfall scenarios;
- Inputted the derived inflow hydrographs for Somerset Dam, Wivenhoe Dam, Lockyer Creek catchment and Bremer River catchment into Somerset and Wivenhoe Dams operations spreadsheet and ran this program;
- Determined gate operations strategies for Somerset and Wivenhoe Dams based on the resulting data from the operations spreadsheet and in accordance with the strategies outlined in the Manual;
- Advised Brisbane City Council, Ipswich City Council and Somerset Regional Council of the gate operations strategies to allow roads to be closed prior to inundation;
- Directed gate operations at the Dams as appropriate by instructing the Dam Supervisors by email and facsimile of gate movements. Instructions were also given verbally by telephone prior to written instructions being released;
- Advised Seqwater's Dam and Source Operations Manager of gate operations by providing a copy of all Flood Operations Directives and regular updates, including advice of longer term strategies to manage the Flood Event. This allowed Seqwater to provide appropriate flood event advice to the public and other stakeholders, including the Queensland Water Commission and the Water Grid Manager;
- Advised the Bureau of Meteorology, Brisbane City Council and the Dam Safety Regulator of the gate operations strategies, and actual and projected water releases from Wivenhoe Dam.

Deleted: When on call, a Senior Flood Operations Engineer or Flood Operations Engineer is referred to as the Duty Flood Operations Engineer. There is always a single Duty Flood Operations Engineer on call at all times, 24 hours a day, seven days a week.

4 FLOOD EVENT PROCEDURES (continued)

4.4 Flood Operations Centre operations

During the Flood Event, the four Flood Operations Engineers worked closely together to ensure the following took place, in accordance with the Flood Procedure Manual:

- Suitable staffing arrangements were in place for the Flood Operations Centre and the impacted Dams for the duration of the Flood Event;
- Staff working in the Flood Operations Centre during the Event signed the Flood Event Shift Log at the start and end of a shift. However, because a number of staff were living in the building housing the Flood Operations Centre during the Event, some sign on and sign off details were not properly recorded. This has been recognised as an area for improvement for future flood events.

During the Flood Event, the Senior Flood Operations Engineer set the overall strategy for the management of the Flood Event, in accordance with the Manual. The Duty Flood Operations Engineers directed the operations of the Flood Control Centre, in accordance with the overall strategy. In situations where two or more Flood Operations Engineers were on duty simultaneously, these duties were shared equally. The Duty Flood Operations Engineers ensured the following actions took place during the Event, in accordance with the Flood Procedure Manual:

- All significant events were recorded in the Event Log;
- The integrity of the ALERT System was maintained;
- Flood releases from the Dams were in accordance with the Manual, and the RTFM was used to support the decision-making processes around the releases;
- Software issues impacting on the operation of the ALERT System were identified and resolved;
- All notifications specified in the Flood Manuals and Emergency Action Plans were recorded in the Event Log;
- Accurate plots of headwater levels were maintained for each of the Dams;
- Appropriate handovers took place at the end of each shift to ensure incoming Officers had the following information:
 - Reservoir storage elevations at each Dam;
 - Radial gate, sluice gate and regulator valve openings at each Dam;
 - Flood release procedures being applied and the reason for their selection;
 - Status of compliance with the Flood Manuals and Emergency Action Plans;
 - Status of the communication systems;
 - Status of the data gathering network;
 - Status of computer systems and Flood Modelling Systems;
 - Any areas of concern associated with the management of the Flood Event;
 - Areas in which the discretion has been exercised, in accordance with the Flood Manuals.
- Flood Officers on duty in the Flood Operations Centre undertook all duties as directed by the Duty Flood Operations Engineer;
- Brisbane City Council, Ipswich City Council and Somerset Regional Council were contacted as appropriate to allow roads to be closed prior to inundation and for any necessary arrangements to be made for community isolation and/or necessary evacuations. (The Manual allows for immediate releases to be initiated if the safety of a Dam is at risk. However, in accordance with Seqwater's duty of care to public safety when making Dam releases, every attempt is made to close impacted roads prior to inundation by water outflows from gate operations, and to make appropriate arrangements for community isolation and evacuations due to the risk to public safety.);
- Gate operations were directed at the Dams as appropriate, by instructing the Dam Supervisors by email and facsimile about gate movements. Instructions were also explained verbally by telephone prior to the written instructions being released;
- Seqwater's Dam and Source Operations Manager was advised of all gate operations through the provision of a copy of all Flood Operations Directives and regular updates, including advice of longer-term strategies

Deleted: by providing a

4 FLOOD EVENT PROCEDURES (continued)

to manage the Flood Event. This allowed Seqwater to provide appropriate flood event advice to the public and other stakeholders, including the Queensland Water Commission and the Water Grid Manager;

- The Bureau of Meteorology, Brisbane City Council and the Dam Safety Regulator were advised of the gate operation strategies and actual and projected water releases from Wivenhoe Dam.

As the Flood Event progressed, a number of potential issues arose. These included the potential for the Flood Operations Centre to lose mains power, and a break-down of the communication link between the main (Turbot Street) and back-up (George Street) Flood Operations Centre. The procedures above helped in addressing these potential issues. Key personnel were notified of the critical nature of the function of the Flood Operations Centre, including ENERGEX and the building managers from both the Turbot Street and George Street locations. Mains power and telephone communication was maintained at the Flood Operations Centre throughout the Event however, the back-up Centre did operate under stand-by power for the period the CBD was flood-affected.

Both the main and back-up Flood Operations Centre are connected to an un-interrupted power supply and emergency standby power facilities to ensure they can continue to operate under flood event conditions.

System functions were not impacted during this Flood Event, however, a problem did arise with the back-up Linux PC (NAAMAH) which houses the redundant Real Time Flood Model (RTFM) system. Some file corruption errors were noted in daily routine system checks. These were attributed to a failure of the file mirroring process that ensures back-up copies of the data in the main Flood Operations Centre PC (NOAH) are captured on the back-up PC (NAAMAH). This problem was quickly rectified by re-booting the back-up PC.

It was noted that, during the Flood Event, when ALERT data captured in the RTFM was compared against equivalent data captured in Enviromon, FLOOD-Col appeared to have received less data for some sensors. This issue will be investigated further as the reason could relate to a number of factors including data transmission, data reception and data filtering processes. The differences were not necessary significant however the reason for this anomaly requires further investigation.

During the Event, the email server in the Flood Operations Centre exceeded its size limit (6MB), requiring the working space to be freed to allow email traffic to flow again. This issue arose due to a combination of the volume of email traffic during certain periods of the Event and also the size of some of the emails being transmitted. A routine clearing of the email server's working area solved this problem and actions will be taken to ensure it does not continue to happen in the roll-out of new Flood Operations Centre IT environment.

Landline phones and facsimiles at Somerset Dam and Wivenhoe Dam were also unavailable for periods of time due to impacts arising from the flood event. However, lines of communication were maintained between the Flood Operations Centre and the Dams through the use of satellite phones, two-way radio, mobile phones, and email.

Seqwater's corporate communications were also impacted due to flooding in the CBD which resulted in parts of the city being disconnected from mains power. Seqwater's corporate computer systems were unavailable for a period during this time, however, this did not impact the functioning of the main or back-up Flood Operations Centre.

4 FLOOD EVENT PROCEDURES (continued)

4.5 Somerset Dam and Wivenhoe Dam preparedness

Prior to the Flood Event, the Seqwater Operations Coordinator responsible for Somerset and Wivenhoe Dams ensured the following actions took place, in accordance with the Flood Procedure Manual:

Deleted: and Somerset Dam

Deleted: during the Event

- At least two Dam Operators were on close call for both Somerset Dam and Wivenhoe Dam at all times;
- Sufficient Dam Operators were available to staff Somerset Dam and Wivenhoe Dam should a major flood event be declared;
- Contact details for the Dam Operators were up-to-date;
- Current copies of the following documents were available at Somerset Dam and Wivenhoe Dam:
 - The Manual of Operational Procedures for Flood Mitigation for Wivenhoe Dam and Somerset Dam (Revision 7);
 - Emergency Action Plan;
 - Standing Operating Procedures;
 - Operation and Maintenance Manual.
- The following facilities were available at Somerset Dam and Wivenhoe Dam:
 - Sufficient stationery and forms;
 - Landline telephone, mobile telephone, satellite telephone, Seqwater radio network, facsimile and email communication systems;
 - Power systems and back-up power systems to ensure computer systems and communication systems were able to operate reliability during the Flood Event.
- All preventive maintenance work was undertaken at both Dams in accordance with the Dam Operation and Maintenance Manuals.
- The flood release infrastructure and associated back-up systems at both Dams was kept operationally ready;
- While on close call, Dam Operators ensured:
 - They were contactable at all times by telephone;
 - In the event of being "unfit for duty" they reported to the Duty Flood Operations Engineer currently on close call;
 - They were able to travel to the Dam they were assigned to within two hours of being called.

4 FLOOD EVENT PROCEDURES (continued)

4.6 Somerset Dam and Wivenhoe Dam mobilisation

Following notification the Flood Event had been declared, the Seqwater Operations Coordinator responsible for Somerset Dam and Wivenhoe Dam, ensured the following actions were completed, in accordance with the Flood Procedure Manual:

Deleted: ,

- The Principal Engineer Dam Safety was notified of the mobilisation;
- Significant events were recorded in the Event Log;
- The Dam Operators on close call were contacted and directed to travel to the Dams. Two Dam Operators were directed to each site and at least two Dam Operators remained on duty at all times during the Event;
- During each shift, a Dam Operator was nominated to be the Dam Supervisor, for the purposes of managing the Flood Event.

Deleted: s

Deleted: ere

Deleted: s

As each Dam Supervisor arrived at their assigned Dam, the Dam Supervisor completed the following actions, in accordance with the Flood Procedure Manual:

- Checked communication existed with the Flood Operations Centre;
- Commenced recording significant events in the Event Log;
- Completed the Flood Readiness Checklist contained in the Flood Procedure Manual (see Appendix I);
- Undertook flood operations as directed by the Flood Operations Centre.

4 FLOOD EVENT PROCEDURES (continued)

4.7 Somerset Dam and Wivenhoe Dam operations

As the Flood Event commenced, the Dam Supervisor at Somerset Dam and Wivenhoe Dam ensured the following actions took place, in accordance with the Flood Procedure Manual. At the beginning of each shift, a new Dam Supervisor was appointed.

- All significant events were recorded in the Event Log;
- Flood releases were undertaken in accordance with directions provided by the Flood Operations Centre;
- All notifications required by the Manuals and Emergency Action Plans were made;
- Handovers at the end of each shift were conducted to ensure incoming Officers were aware of:
 - Reservoir storage elevations at each Dam;
 - Radial gate, sluice gate and regulator valve openings at each Dam;
 - Status of the communication systems;
 - Any areas of concern associated with the management of the Flood Event.
- The Duty Flood Operations Engineer was advised of any issues arising during the Event, with the potential to adversely impact flood operations.

(Note: During the Event, Wivenhoe Dam experienced a temporary loss of mains power, however, this did not impact Dam operations because the on-site, standby diesel generator provided full power during this time. Two other separate back-up power systems were also available to ensure the continued operation of the radial gates if needed.)

5 DATA COLLECTION SYSTEM PERFORMANCE

5.1 Background

A real time flood monitoring and forecasting system has been established to monitor rainfall and water levels in the Dam catchments and to provide adequate, accurate and timely information for informed decision-making.

Field stations consisting of rainfall and water level gauges use the Event Reporting Radio Telemetry System (ERRTS) to communicate data to the Flood Operations Centre. More than one gauge may be located at an individual field station. Water level gauges are often located at the Department of Environment and Resource Management (DERM) gauging stations. DERM is responsible for the maintenance of the water level gauges and Seqwater for the ERRTS equipment.

Rainfall gauges consist of a standard tipping bucket. Water level gauges vary in type and model but include shaft encoders, wet pressure transducers and dry pressure transducers. At a rainfall gauge, an event is defined as the tip of the bucket. At a water level rainfall gauge, an event is defined as an incremental increase or decrease in water level.

When an event is triggered at a gauge, data is transmitted via VHF radio through a series of redundant radio repeaters to the Flood Operations Centre and other data collection centres. Each signal has a unique identification number. When the signal arrives at the Flood Operations Centre base station, it is relayed to computer hardware platforms serial port via a decoder. It is then time stamped, read, decoded, accepted or rejected, filtered, validated and then stored in a gauge database in the Centre's FLOOD-Col and Enviromon databases. Redundant base stations at Mineral House and the Land Centre in Brisbane's CBD are synchronised with the Flood Operations Centre database.

The FLOOD-Col and Enviromon databases contain gauge details including:

- Gauge name;
- ALERT number;
- Type of gauge;
- Calibration information;
- Alarm thresholds;
- Rating curve information, if applicable.

Both FLOOD-Col and Enviromon allow filtered gauge data to be viewed in either a text or graphical format. Information that can be viewed or edited includes height, discharge, rainfall pluviographs, rainfall hyetographs, lake levels and Dam volumes, and applications are also available for viewing groups of gauges.

The combination of ERRTS field stations, rainfall gauges and water level gauges, radio network and data collection software is referred to as an ALERT system. ALERT, or Automated Local Evaluation in Real Time System, has become a standard for flood warning systems in Australia and the United States of America, and is widely used by the Bureau of Meteorology (BoM) and other flood warning agencies throughout the world.

FLOOD-Ops is the modelling software used to analyse and produce forecast runoff. It extracts data from the FLOOD-Col database, calculates areal rainfalls and generates hydrographs of runoff. Model parameters can be adjusted and forecast rainfall included as an option. Results can be displayed and imported into gate operation models. The ALERT system, FLOOD-Ops and ancillary software make up the Real Time Flood Model (RTFM).

5 DATA COLLECTION SYSTEM PERFORMANCE (continued)

5.2 Field station descriptions

Seqwater operates 75 rain gauges and 71 river gauge field stations within and around the Brisbane River Basin. Of these 146 sites, 129 operate under the ALERT system and the remaining 17 operate as telephone telemeter gauging stations, but are not directly available in the operational suite.

Manual gauge board readings are taken at Somerset and Wivenhoe Dams to confirm the ALERT data received from these sites. These manual observations form the basis of gate operations.

In addition to the Seqwater owned and operated network, the Flood Operations Centre also has access to Enviromon, which collects data from an additional 225 rain gauges and nearly 200 water level gauges throughout South East Queensland.

Locations of the rainfall stations are shown in Figure 5.2.1, and the Seqwater water level network is shown in Figure 5.2.2.

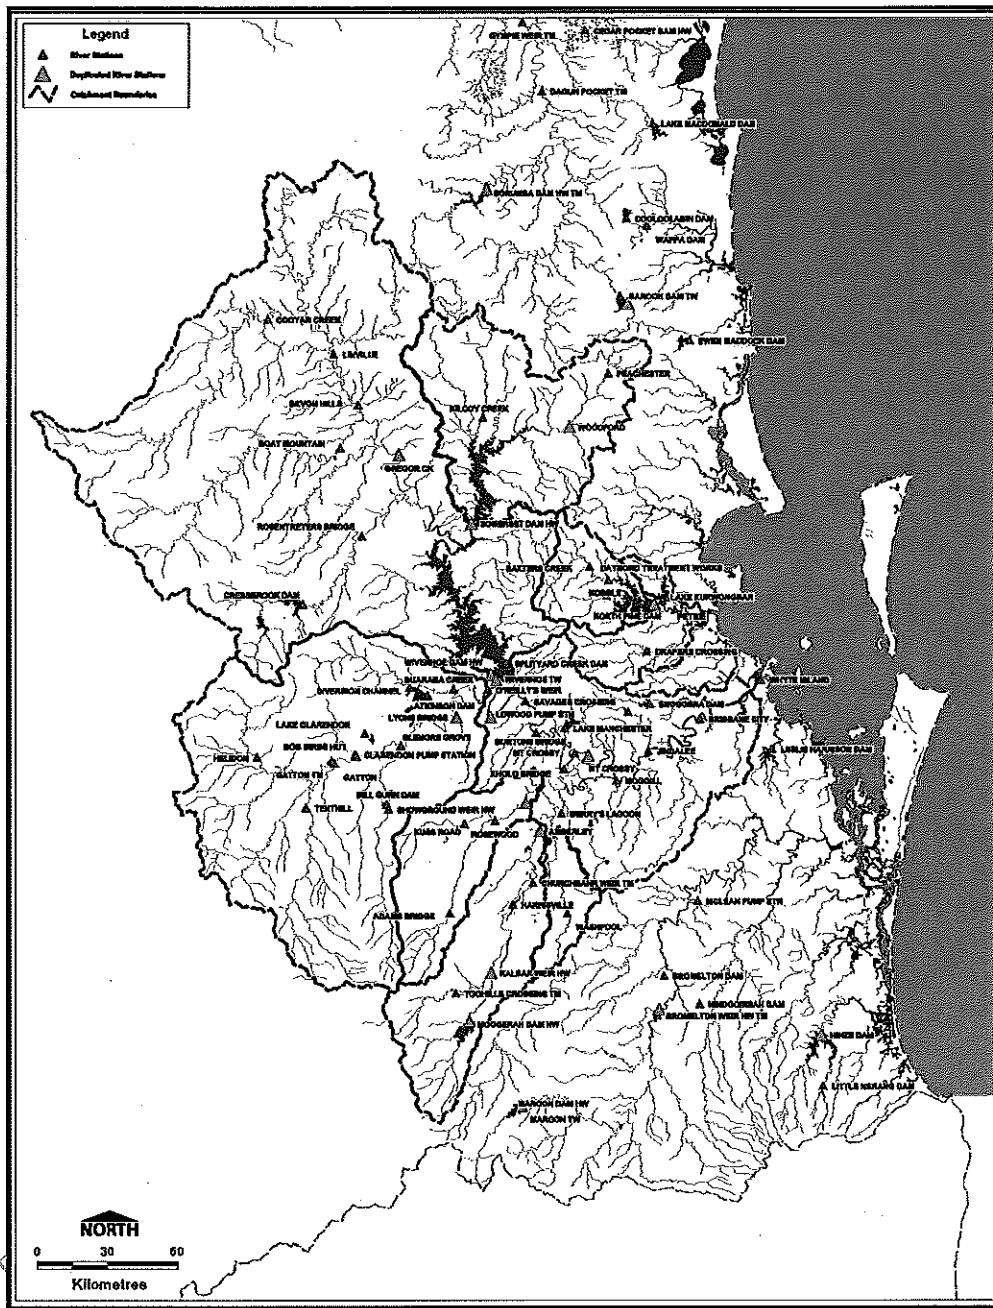

Figure 5.2.2 – Seqwater water level network as at January 2011

Deleted: ALERT

Prior to the January 2011 Flood Event, four out of 75 rain gauges (95% availability) and six out of 71 river gauges (92% availability) were marked as being 'out of action'. In line with standard practice, the data collected from some gauges was also marked as 'suspect' at that time, and therefore required examination prior to being used in modelling. These gauges are listed in Table 5.2.3 and Table 5.2.4.

Deleted: floods

5 DATA COLLECTION SYSTEM PERFORMANCE (continued)

In many instances, more than one gauge is located on an individual station site to allow for the periodic non-operation of individual gauges. Accordingly, due to this in-built network redundancy, the presence of these non-operational gauges did not impact on data quality during the Event.

Rain ID	Site	Status date 6 Jan 2011	Comment
6517	Gregors Creek AL-B	Out of action	Redundant gauge. Another rainfall gauge is available at this site.
6526	Helidon AL	Out of action	Data from adjacent stations at Toowoomba and Gatton was used as a substitute for this data. However, data from this station was available for use through the BoM Environ system.
6600	Kilcoy AL	Suspect	Although this data was marked suspect and was missing occasional observations, upon review, the data appeared correct and was used in modelling.
6736	Kuss Road AL	Out of action	This site is located in the Bremer River catchment and the data is of limited value in gate operations decision making.
6646	Lowood AL-B (pump station)	Suspect	Although this data was marked suspect and was missing occasional observations, upon review, the data appeared correct and was used in modelling. This gauge is also a redundant gauge. Another rainfall gauge is available at this site.
6621	Nukinenda AL	Suspect	Although this data was marked suspect and was missing occasional observations, upon review, the data appeared correct and was used in modelling.
6559	Savages Crossing AL	Suspect	Although this data was marked suspect and was missing occasional observations, upon review the data appeared correct and was used in modelling.
6593	Somerset Dam HW AL-P	Suspect	Although this data was marked suspect and was missing occasional observations, upon review, the data appeared correct and was used in modelling. This gauge is also redundant gauge. Another rainfall gauge is available at this site and manual readings are also available.
6995	Somerset Dam HW AL-B2	Suspect	Redundant gauge. Another dam height gauge is available at this site and manual readings are also available.
6565	Tenthill AL	Suspect	Although this data was marked suspect and was missing occasional observations, upon review, the data appeared correct and was used in modelling.
6602	Top of Brisbane AL	Suspect	Although this data was marked suspect and was missing occasional observations, upon review, the data appeared correct and was used in modelling.
6744	Wilson's Peak AL	Out of action	Data from adjacent stations at Tarome and Kalbar was used as a substitute for this data.
6540	Yarraman AL	Suspect	Although this data was marked suspect and was missing occasional observations, upon review, the data appeared correct and was used in modelling.

5 DATA COLLECTION SYSTEM PERFORMANCE (continued)

River ID	Site	Status date 6 Jan 2011	Comment
6654	Amberley AL-B	Out of action	Redundant gauge. Another stream height gauge is available at this site. This station has been marked for relocation.
6652	Amberley AL-P	Suspect	This data was marked suspect as it was reporting at a high frequency, however, upon review, the data appeared correct and was used in modelling.
6524	Cressbrook Dam AL	Out of action	The downstream stream height gauge at Rosentretter provides more useful information than this site.
6518	Gregors Creek AL-B	Out of action	Redundant gauge. Another river height gauge is available at this site.
6650	Lowood AL-P	Out of action	Redundant gauge. Another river height gauge is available at this site.
6631	Lyons Bridge AL-B	Suspect	This data was marked suspect as it was reporting erratically however, upon review, the data appeared correct and was used in modelling. Additionally, this is a redundant gauge. Another river height gauge is available at this site.
6594	Somerset Dam HW AL-P	Suspect	This is a redundant gauge. Another dam height gauge is available at this site and manual readings are also available. Only a slight difference was noted between this gauge and the manual observations.
6566	Tenthill AL	Out of action	The downstream stream height gauge at Gatton provides more useful information than this site.
6743	Walloon AL-B	Out of action	This is a redundant gauge. Another river height gauge is available at this site.
6642	Wivenhoe Dam TW AL-B	Suspect	Gate settings and discharge curves provide more accurate flow estimates than this gauge during flood releases.

Table 5.2.4 – Water level gauges marked out of action or suspect at Flood Event commencement

The January 2011 Flood Event damaged a number of stations. After the Event, eight out of 75 rain gauges (89% availability) and 16 out of 71 river gauges (77% availability) were marked 'out of action'. In line with standard practice, the data collected from some gauges was also marked as 'suspect' during the Flood Event, and therefore required close examination prior to being used in modelling. Details of all these stations are contained in Table 5.2.5 and Table 5.2.6.

Deleted: floods

Deleted:

Some gauges did not operate during the Flood Event as some sites were inundated with water, damaged by debris, impacted by lightning strikes or lost power. There were also some stations completely destroyed by the flood flows. In surveying the aftermath of the flood and its impacts along the river channels, it is easy to see how this occurred.

5 DATA COLLECTION SYSTEM PERFORMANCE (continued)

For the duration of the Flood Event, just over 130,000 individual observations, 32,000 rainfall readings and nearly 100,000 water level readings were received from the ALERT network in the Flood Operations Centre. This provides an indication of the system load that is required to be managed during the Event.

5 DATA COLLECTION SYSTEM PERFORMANCE (continued)

5.3 Network maintenance

Seqwater's hydrographic unit is responsible for the operation and maintenance of the rainfall and water level network. This unit is assisted by RoadTek, a division of the Department of Transport and Main Roads.

Most rainfall stations are stand-alone instruments or are co-located with river level stations. Where possible, ALERT water level gauges take advantage of data provided by DERM-owned and maintained gauging stations to provide a robust source of reliable water level sensing.

A number of the sites damaged during the January 2011 Flood Event have already been reinstated by Seqwater staff.

6 EVENT DATA

6.1 Introduction

A real time flood monitoring and forecasting system has been established to monitor rainfall and water levels in the Dam catchments and to provide adequate, accurate and timely information for informed decision-making. This system is described in detail in Section 5. Following is a description of the operational rainfall and river height data collected during the January 2011 Flood Event using this system, as well as a description of other supporting information used by the Flood Operations Centre to support decision-making during the Event.

It should be noted, the data contained in this Section is operational data which was collected during the Event and upon which operational decisions were made. The data is considered accurate, however only real time validation of the data has been undertaken. Given the time constraints for preparation of this Report, it is recognised that more information may become available over time to add to the Event data presented in this Section.

6.2 Forecast rainfall

Forecast rainfall tools provided by the Bureau of Meteorology (BoM) that were examined and considered in decision making during the January 2011 Flood Event were:

- 24 hour Quantitative Precipitation Forecasts (QPF) for the Dam catchments.
- The weather radar (available through www.bom.gov.au);
- SILO meteograms forecast rainfall (based on BoM ACCESS Model);
- Interactive weather and wave forecast rainfall maps (based on ACCESS Model);
- Water and the land forecast rainfall (based on an ensemble of several numerical weather prediction models);
- Severe weather warnings.

Of these, QPF are considered the primary forecast tool as they are provided by BoM to give specific forecast information in relation to the Dam catchment areas. The QPF leading up to and during the Event are shown in Table 6.2.1 following. In relation to the data shown in this table, the following observations can be made,

- The QPF provided a reasonable representation of the actual daily rainfall recorded until 16:00 Saturday 8 January 2011. The 11 forecasts issued to 16:00 Saturday 8 January 2011 overestimated rainfall during this period by only 21%. This is considered an excellent result. However, the total catchment average rainfall recorded during this five day period was only in the order of 100mm.
- In the five forecasts issued between 16:00 Saturday 8 January 2011 and 10:00 Tuesday 11 January 2011, the QPF underestimates daily actual catchment average rainfall by between 160% to 340%, with an average error of 225%. This was the critical rainfall period, with the catchment average rainfall recorded during this two and a half day period being in the order of 300mm.
- For the two forecasts issued during the period between 10:00 Tuesday 11 January 2011 and 16:00 on Tuesday 11 January 2011, the QPF overestimates daily actual catchment average rainfall by between 196% to 625%, with an average error of 270%. The total catchment average rainfall recorded during this period was only in the order of 45mm.
- The QPF provided a reasonable representation of the actual rainfall recorded after 10:00 on Wednesday 13 January 2011.

Table 6.2.1 – Actual and forecast rainfall comparison (BoM QPF)

As well as examining and modeling the QPFs, the ACCESS model result data provided by BoM allows three day and five day rainfall forecasts to be examined and considered in flood event decision making.

A summary of this data is shown in the following table that contains translated rainfall forecasting results using ACCESS model result data provided by BoM during the critical period of the Event (between 6 and 11 January 2011). The original BoM data has been translated to forecast catchment average rainfall results, based on a derived catchment centroid rainfall, estimated by using Seqwater's Flood Early Warning Modelling System.

Table 6.2.2 Actual and forecast rainfall comparison (BoM ACCESS model)

Deleted: 1

Table 6.2.2 above shows:

- There are variations in excess of 700% between successive three-day catchment average rainfall forecasts made 12 hours apart;
- There are variations in excess of 700% between successive five-day catchment average rainfall forecasts made 12 hours apart;
- There are eight instances in which actual rainfall recorded is greater than 200% (highest is more than 1,000%) of the three-day forecast rainfall;
- There are three instances in which the three-day forecast rainfall is greater than 150% (highest is 280%) of the actual rainfall recorded;
- There are nine instances in which actual rainfall recorded is greater than 300% (highest is over 1,000%) of the five-day forecast rainfall;
- There are two instances in which the five-day forecast actual rainfall is greater than 200% (highest is 280%) of the actual rainfall recorded.

These results show that three day and five day forecasts only provide an indication of future rainfall and these forecasts cannot be used as a basis of flood operations decision making where public safety in both rural and urban areas is directly impacted. This forecasting information uses the most up-to-date technology available within BoM at the present time. Future improvements in this area will be examined with interest in order to maximise the flood mitigation benefits of the Dams.

6 EVENT DATA (continued)

6.3 Event rainfall totals

As discussed in Section 5, Seqwater uses a network automated rainfall stations within the Brisbane River catchment area to gather rainfall data during flood events. Data from this network is automatically collected in real time using a radio telemetry collection system and sent in real time to the Flood Operations Centre. Every millimetre of rainfall recorded at each station is sent immediately to the Flood Operations Centre as it is recorded.

Data sent to the Flood Operations Centre in this way is operational data that has not been validated. Both manual and automatic data checking was undertaken in the Flood Operations Centre at regular and routine intervals over the course of the Event.

Table 6.3.1 shows the daily rainfall totals collected by the Flood Operations Centre (both **FLOOD-Col** and **Enviromon**) at each of the rainfall stations during the Event. Stations highlighted in **bold** are configured in the flood models and used in modelling of flows.

Table 6.3.1 – Daily rainfall totals by station for the duration of the January 2011 Flood Event

DRAFT ONLY - THIS DOCUMENT IS UNAPPROVED

6 EVENT DATA (continued)

The following maps (Figure 6.3.2 to Figure 6.3.11) illustrate the data in Table 6.3.1.

Rainfall in the 24 hours to 09:00, Wednesday 5 January 2011

In the 24 hours to 09:00, Wednesday 5 January 2011, only small rainfall totals, generally less than 5mm, were recorded in the Brisbane Basin. The word "None" on the map signifies that no reports were received from the station during the period. Figures in red also indicate errors in the data. The 24 hour totals in table 6.3.1 were created after the event with the full data record for the event present. The 24 hours totals for each day on the map may be slightly different as they represent the data as it was at that point in time. If a data signal had not yet been received then the interpolations to 9:00 am will vary from the complete data set.

6 EVENT DATA (continued)

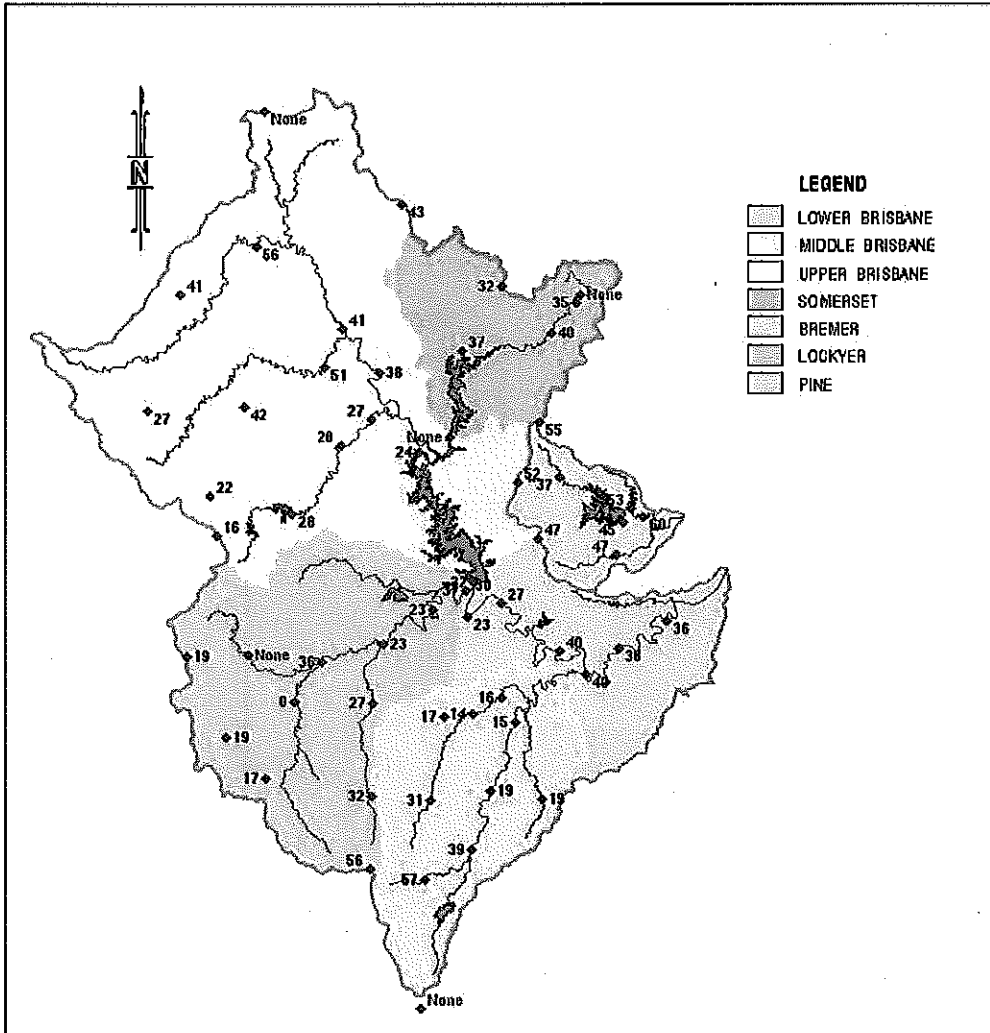

Deleted: on

Rainfall in the 24 hours to 09:00, Thursday 6 January 2011

In the 24 hours to 09:00, Thursday 6 January 2011, widespread rainfall was recorded throughout the area, with totals ranging from 20mm to 56mm. The highest totals in this period were concentrated in the Upper Brisbane catchment, around Boat Mountain and Cooyar.

6 EVENT DATA (continued)

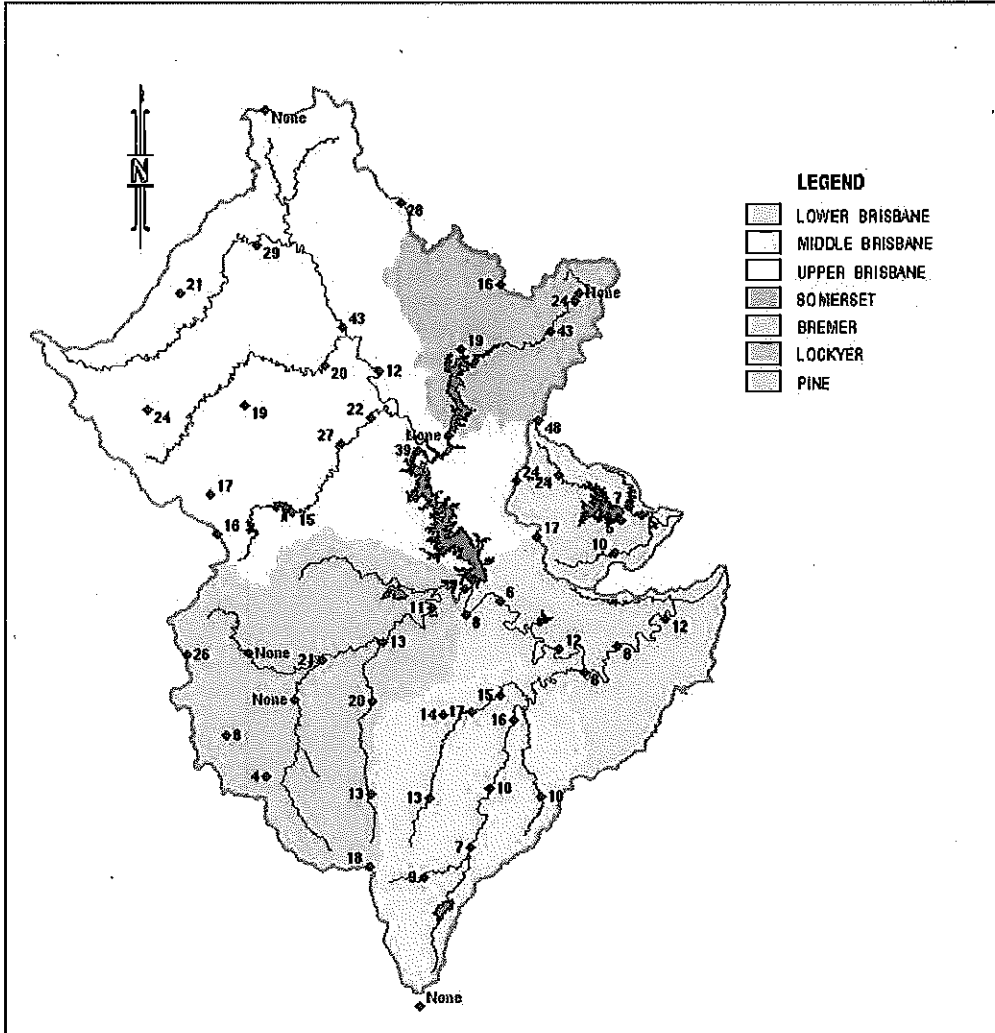

Deleted: on

Rainfall in the 24 hours to 09:00, Friday 7 January 2011

Compared to the previous period, rainfall generally eased in the 24 hours to 09:00, Friday 7 January 2011. Rainfall in the period was again wide-spread, however totals were generally between 10mm to 30mm, with an occasional isolated higher total in the Upper Brisbane River and Stanley River catchments.

6 EVENT DATA (continued)

Rainfall in the 24 hours to 09:00, Saturday 8 January 2011

The highest totals in the 24 hours to 09:00, Saturday 8 January 2011 were recorded in the headwater areas around Ferris Knob and Bellthorpe West, with totals around 100mm. High rainfall continued to be recorded in the Upper Brisbane River around Devon Hills. Elsewhere in the basin downstream of Wivenhoe Dam, totals were generally less than 10mm.

DRAFT

Rainfall in the 24 hours to 09:00, Sunday 9 January 2011

Deleted: on

Rainfall throughout the basin was widespread in the 24 hours to 09:00, Sunday 9 January 2011. Totals were generally below 30mm, but with isolated higher totals just over 40mm in the upper reaches of the Stanley River catchments around Ferris Knob and around the centre of the Upper Brisbane River catchment around Devon Hills.

DRAI

Rainfall in the 24 hours to 09:00, Monday 10 January 2011

The rainfall in the 24 hours to 09:00, Monday 10 January 2011 was especially high in the Stanley River catchment. The highest daily Event total of 310mm was recorded at Bellthorpe West. Falls in other parts of the Stanley River catchment ranged from 180mm to 250mm in the same period. In the Upper and Middle Brisbane River catchments, 24-hour totals ranged from 73mm at St Aubins to 284mm at Mt Glorious just east of Wivenhoe Dam. Widespread rain between 100mm and 200mm was recorded in other parts of the catchment.

Rainfall in the Lockyer Creek catchment ranged from 15mm at Woodbine West to nearly 80mm at Toowoomba. The heaviest falls in the Bremer River system were concentrated in the lower reaches, with totals of up to 70mm recorded. In the headwater of the Bremer River, totals were much lower. This was the first day since the start of the Event that heavy rainfall was recorded in the Lower Brisbane River catchment, with 24 hour totals up to 113mm.

6 EVENT DATA (continued)

Rainfall in the 24 hours to 09:00, Tuesday 11 January 2011

Heavy rain continued to be recorded throughout the Brisbane Basin in the 24 hours to 09:00, Tuesday 11 January 2011, with the highest totals in the area around the Lower Middle Brisbane River and upper reaches of the Lower Brisbane River catchment, with totals up to 262mm at Mt Glorious. In the Stanley River catchment, totals between 80mm and 130mm were again reported widely throughout the catchment.

Particularly heavy rainfall was recorded in the upper reaches of Lockyer Creek around Toowoomba, which recorded 116mm in the period, with most of this falling the previous afternoon. Very large totals were also recorded in the headwater area of Laidley Creek, where nearly 200mm was reported at Mount Castle. In the Bremer River catchment, rainfall was still widespread, although totals were generally below 70mm.

Totals in the Lower Brisbane River area were generally below 30mm, although there were very high totals around Fernvale.

6 EVENT DATA (continued)

Rainfall in the 24 hours to 09:00, Wednesday 12 January 2011

Deleted: on

High rainfall continued to be recorded in the upper reaches of the Stanley River, with falls in excess of 220mm in the 24 hours to 09:00, Thursday 12 January 2011.

Deleted: on

In the Upper Brisbane River catchment, rainfall had eased with 24-hour totals generally less than 30mm. However, heavy rainfall continued in the area around Wivenhoe Dam and just south, with totals between 150mm and 230mm in the area, most of which fell in the previous afternoon.

Deleted: upper

Heavy rain continued in the Laidley Creek, Bremer River and Warrill Creek catchments, with totals up to 120mm.

Deleted: lower

Elsewhere in the Lower Brisbane River catchment, totals ranged from 40mm to 70mm.

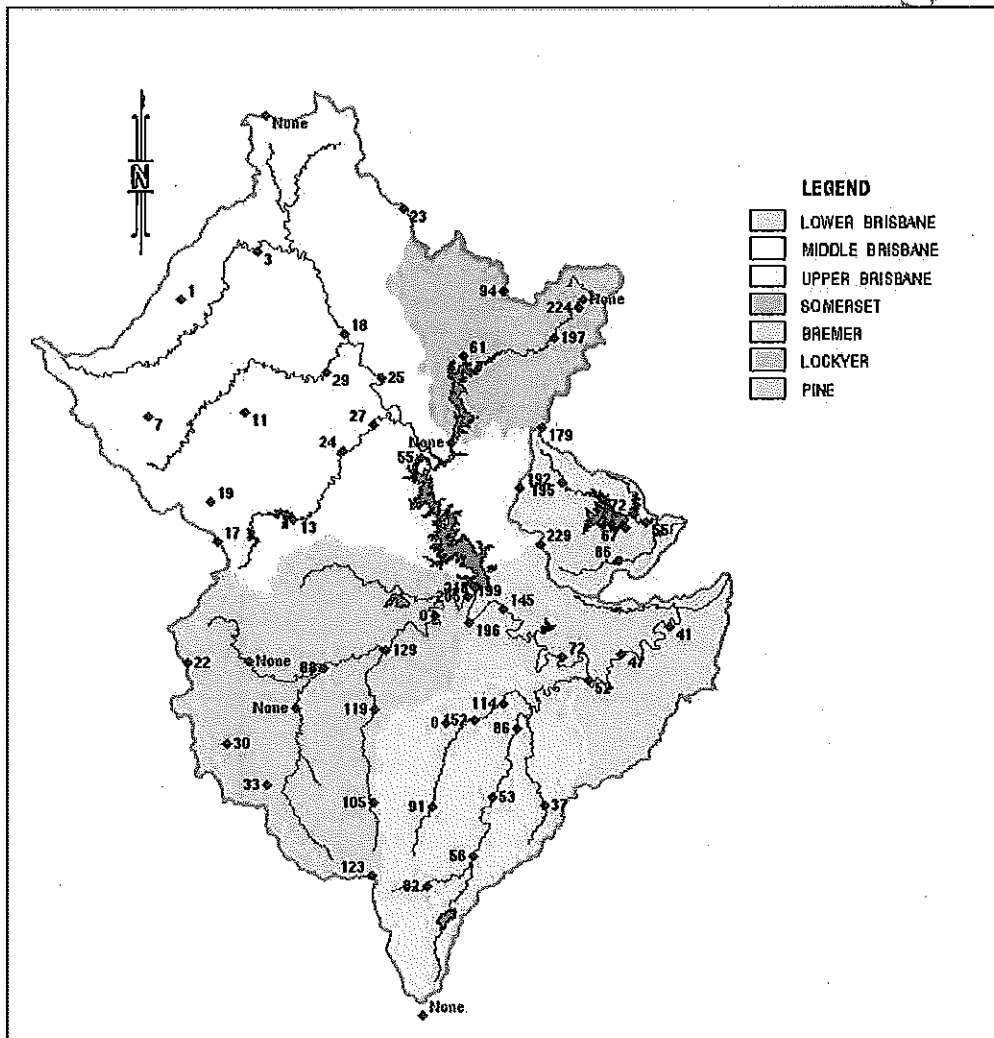

Figure 6.3.9 – Rainfall in the 24 hours to 09:00, Wednesday 12 January 2011

6 EVENT DATA (continued)

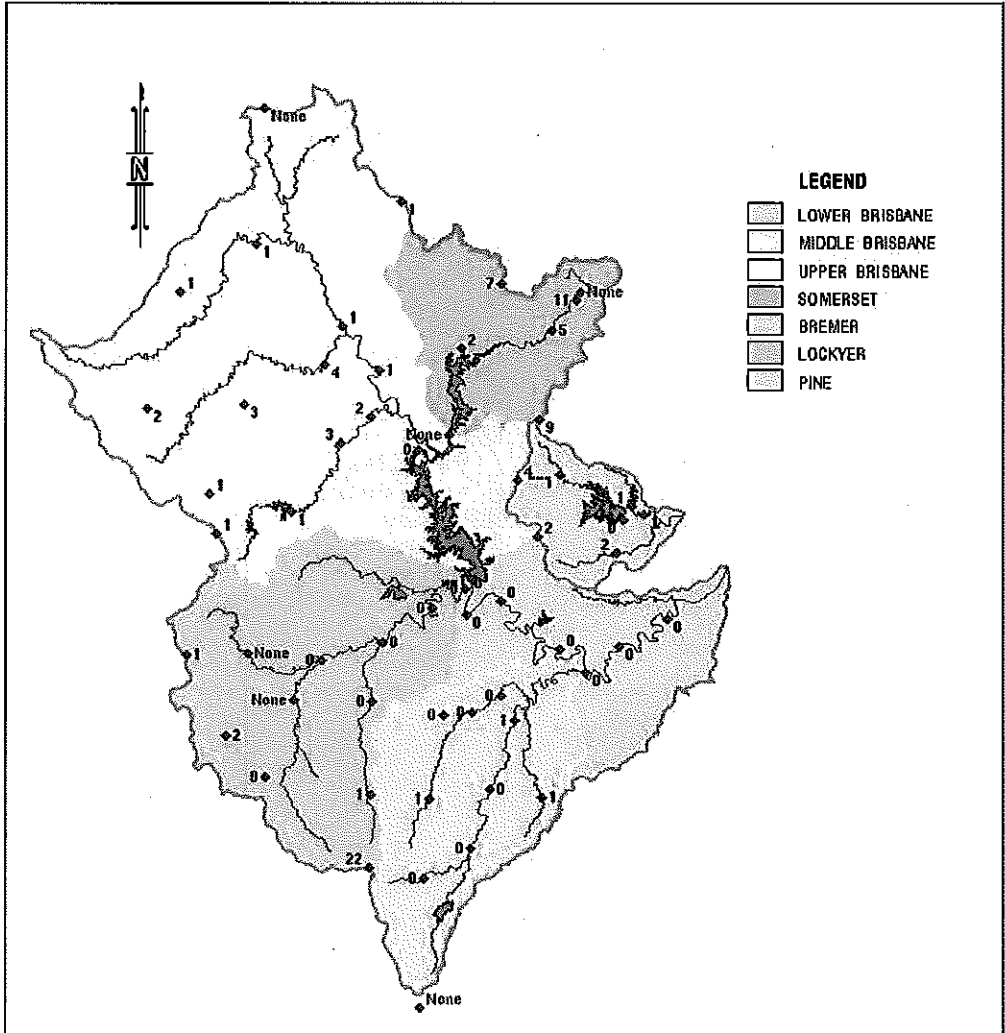

Deleted: on

Rainfall in the 24 hours to 09:00, Thursday 13 January 2011

By 09:00, Thursday 13 January 2011, the rainfall event was virtually complete, with totals generally below 10mm in the 24-hour period, with only an isolated higher total of 22mm at Mount Castle in Upper Laidley Creek.

DRAFT

Figure 6.3.10 - Rainfall in the 24 hours to 09:00, Thursday 13 January 2011

6 EVENT DATA (continued)

Rainfall in the six days to 09:00, Thursday 13 January 2011

Deleted: on

Figure 6.2.11 below shows the rainfall distribution during the six-day period to 09:00, Thursday 13 January 2011.

Deleted: on

The highest totals were recorded in the headwater ridges in the Stanley River catchment and along the D'Aguilar Range from Mt Mee to Mt Glorious. Elsewhere through the Stanley, Upper Brisbane River and Middle Brisbane River catchments, rainfall totals - while still significant - were half those recorded at elevated stations.

Deleted: upper

Deleted: middle

This effect was not as pronounced in the Lockyer Creek and Bremer River catchments, where the totals over the period tended to be more uniform. In the Lower Brisbane River area, totals in urban areas were half of those recorded around Fernvale and Lowood.

Deleted: lower

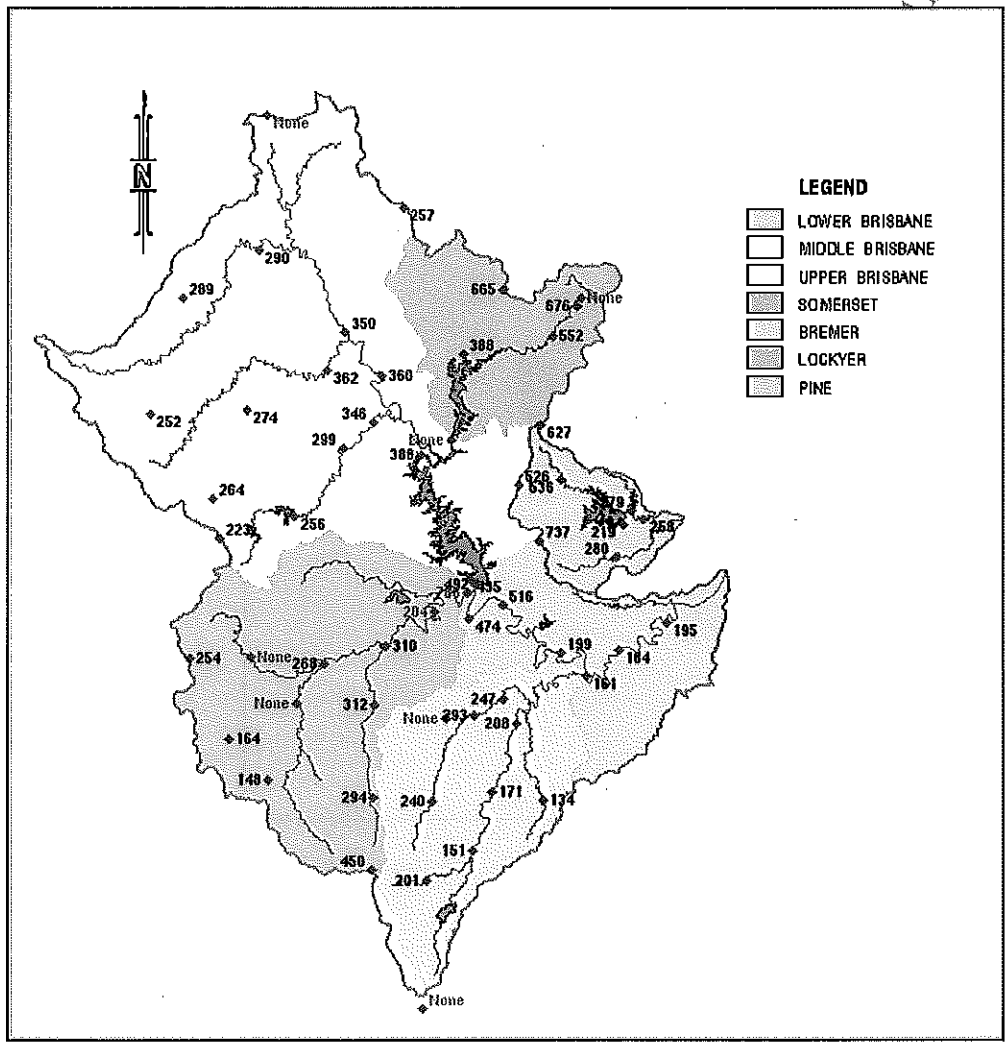

Figure 6.3.11 - Rainfall in the six days to 09:00, Thursday 13 January 2011

6 EVENT DATA (continued)

Over the nine-day period ending 09:00, Thursday 13 January 2011, the highest rainfall total in any of the Seqwater operated gauges was 814 millimetres at the Mt Glorious gauge, just to the east of Wivenhoe Dam.

Deleted: on

Individual highest daily (24 hours to 09:00 on the date indicated) rainfall includes:

- Bellthorpe West 106mm, Sunday 9 January 2011
- Bellthorpe West 310mm, Monday 10 January 2011
- Mt Glorious 262mm, Tuesday 11 January 2011
- Lyons Bridge 242mm, Wednesday 12 January 2011

Average rainfall for each subcatchment in the Brisbane Basin is determined by applying a weighting to the rainfall depth at each available station within the subcatchment. Within the operational system, the Brisbane Basin is divided into the two subcatchments shown in the table below.

The Somerset catchment represents the average catchment rainfall in the Stanley River to Somerset Dam.

The Upper Brisbane River catchment, as represented in Table 6.3.12, represents the total Wivenhoe Dam catchment, excluding the Somerset Dam catchment, and is a weighted average of the Upper and Middle Brisbane River catchments shown in Figure 6.3.13. For example, the weighted average of the Upper Brisbane River catchment (359mm) and Middle Brisbane River catchment (529mm) shown on the map gives a catchment average of 401mm for the Event.

Table 6.3.12 – Daily rainfall throughout the total Wivenhoe Dam catchment (excluding Somerset Dam catchment)

The following map (Figure 6.3.13) illustrates the data contained in Table 6.3.12, summarised over the period of the Event during which significant rainfall was recorded. Catchment rainfall in the eight days to 09:00, Thursday 13 January 2011.

Deleted: on

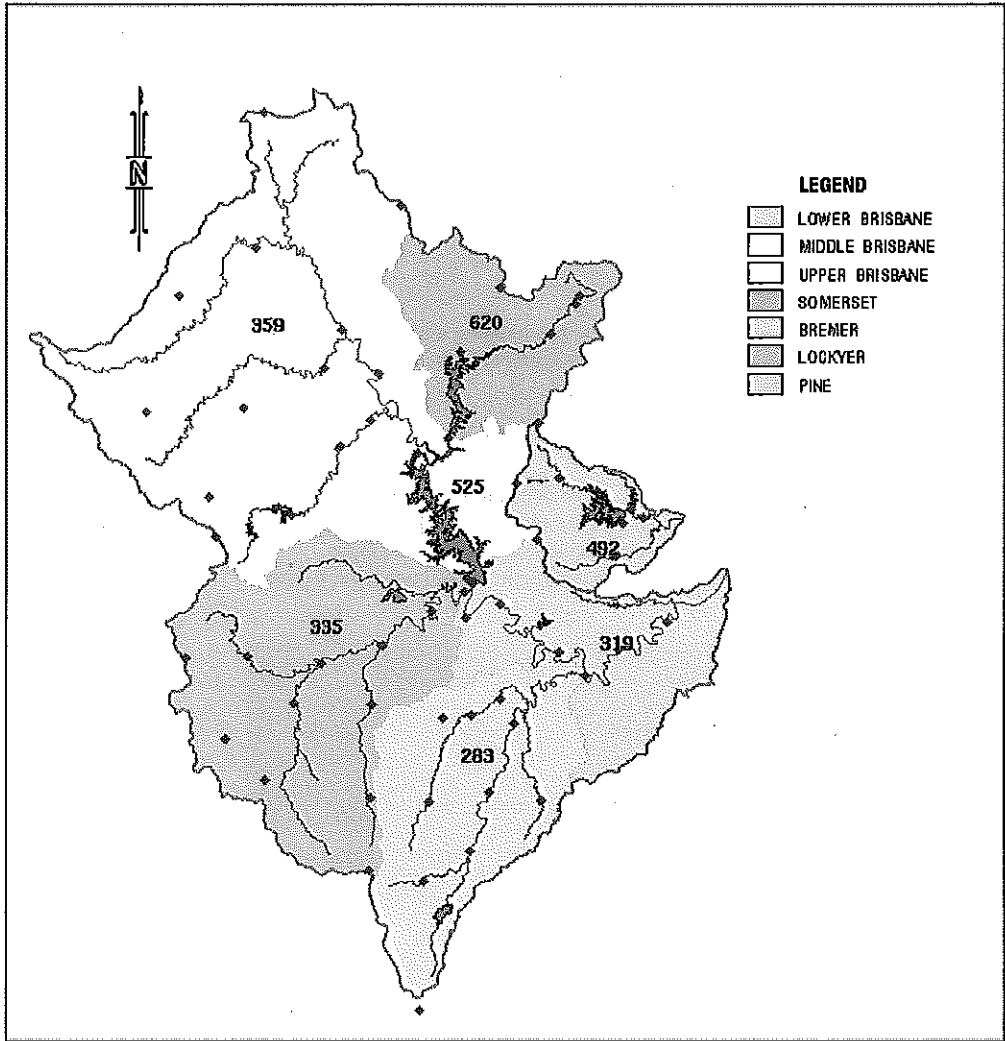

Figure 6.3.13 - Catchment rainfall in the eight days to 09:00, Thursday 13 January 2011

The following catchment average rainfall hyetographs (Figure 6.2.14 to Figure 6.2.19) do not necessarily reflect the localised high intensity rainfall recorded throughout the Basin at various times and locations.

Catchment rainfalls can include hourly intensities at individual stations which can be up to five times the catchment average.

Figure 6.3.14 – Stanley River average hourly rainfalls

Figure 6.3.15 – Upper Brisbane River average hourly rainfalls

Figure 5.3.16 – Middle Brisbane River average hourly rainfalls

Figure 5.3.17 – Lockyer Creek average hourly rainfalls

Figure 6.3.18 – Bremer River average hourly rainfalls

Figure 6.3.19 – Lower Brisbane River average hourly rainfalls

The average catchment rainfall graphs clearly show a number of individual and linked rainfall bursts over the duration of the Event. The two most intense bursts occurred relatively late in the Event between the following periods:

- The morning and evening of Sunday 9 January 2011
- The early morning and afternoon of Tuesday 11 January 2011, interspersed with a period of lower rainfall.

6 EVENT DATA (continued)

An intense burst at the end of the Event, followed by a relatively sudden end to the rainfall, is characteristic of most of these temporal patterns. Tables of hourly rainfall for all stations used during the Event (demonstrating this pattern) are contained in Appendix O, with one table per day during the period Wednesday 5 January 2011 to Thursday 13 January 2011.

Significant hourly rainfall totals include:

Location	Time and date	Hourly rainfall (mm)
Lindfield in the upper reaches of Sheepstation Creek	14:00, Sunday 9 January 2011	54
Blackbutt in the upper reaches of the Brisbane River	16:00, Sunday 9 January 2011	54
Savages Crossing on the Brisbane River near Fernvale	09:00, Tuesday 11 January 2011	93
Ferris Knob in the upper reaches of the Stanley River	11:00, Wednesday 12 January 2011	69

6 EVENT DATA (continued)

6.4 Event rainfall temporal patterns

Temporal patterns are critical to the flood modelling process and the resulting inflow hydrographs. They define the distribution of the rainfall with time, and indicate the distinct periods of heavy rainfall that occurred throughout the Brisbane Basin. Temporal patterns for selected representative stations are contained in Appendix T. The following conclusions can be drawn from examining this data:

- For this Event, the West Bellthorpe gauge represents the temporal pattern of the Somerset Dam catchment.
- For this Event, the Gregors Creek gauge represents the temporal pattern of the catchment area in the upper reaches of the Brisbane River.
- The period of heaviest rainfall recorded in both the West Bellthorpe gauge and the Gregors Creek gauge occurred on the afternoon and evening of Sunday 9 January 2011.
- At Toowoomba, near the headwaters of Lockyer Creek, high intensity rainfall occurred on the afternoon of Monday 10 January 2011 and resulted in flash flooding. This rainfall was not closely reflected in the catchment average rainfall patterns.
- Around the time floodwaters (resulting from the first period of heavy rainfall) arrived at Wivenhoe Dam from the upper reaches of the Brisbane River, the next critical period of heavy rainfall fell on the morning of Tuesday 11 January 2011 in the area immediately around the Wivenhoe Dam reservoir. This huge burst of inflow into the Dam required immediate action to avoid a situation that would risk the safety of the Dam.
- Hourly rainfall totals during the critical period of heavy rainfall, on the morning of Tuesday 11 January 2011 in the area immediately around Wivenhoe Dam, are summarised in Table 6.4.1. The table shows heavy rainfall commenced about 05:00 and continued until 14:00 with totals of nearly 400mm. This is believed to have contributed to the very high level inflows into Wivenhoe Dam during this period.

6 EVENT DATA (continued)

6.5 Event water levels

Seqwater uses a network of 34 automated stream height stations within the Brisbane River catchment area to gather Dam level and stream height data during flood events. Data from this network is automatically collected in real time using a radio telemetry collection system and is sent in real time to the Flood Operations Centre. Every recorded change in water level at each station is also sent directly to the Flood Operations Centre as it is recorded.

Data sent to the Flood Operations Centre in this way is operational data and is not validated. Both manual and automatic data checking is undertaken in the Flood Operations Centre at regular and routine intervals over the course of the Event.

While the vast majority of the water level data contained in this Report was collected automatically via the Seqwater ALERT network, manual observations of gauge boards at Somerset and Wivenhoe Dams were also collected via email and phone during the Event. These gauge board observations are more reliable than the automatically provided readings and, therefore, provided the basis for gate operations at the Dams.

Table 6.5.1 includes details of the peak heights recorded by the automatic gauging stations used during the Event. Multiple peaks were recorded at a number of stations through the period and are shown in the table in descending order. The table is based on data received in the Flood Operations Centre during the Event and has not been verified by field survey. The figures identified in *italics* are the maximum heights recorded prior to failure of the gauge.

Table 6.5.1 – Peak heights recorded at automatic gauging stations during the January 2011 Flood Event

Height hydrographs (Figure 6.5.2 to Figure 6.5.12) for selected key stations within the Brisbane River Basin are plotted below. During the Event, Flood Officers were responsible for basic data checking. A full set of the heights recorded at each flood monitoring station is contained in Appendix Q.

Formatted: Font color: Red

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHECKED OR VERIFIED DATA

Stanley River at Woodford

The Stanley River at Woodford is a key gauging station upstream of Somerset Dam, however it only represents around 20% of the catchment to the Dam. This gauge operated reliably and provided sufficiently accurate operational data for modelling purposes during the Event.

Figure 6.5.2 – Gauge height, Stanley River at Woodford

DRAFT ONLY - THIS DOCUMENT CONTAINS NO COPY

Somerset Dam

There are two automatic gauges at Somerset Dam, which provided readings slightly under the manual gauge board readings. As discussed previously, Dam operations were based on the data provided by gauge board readings.

Figure 6.5.3 - Gauge height, Somerset Dam

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CONFIDENTIAL INFORMATION

Brisbane River at Gregors Creek

The Brisbane River at Gregors Creek is the key gauging station upstream of Wivenhoe Dam. When combined with the outflow from Somerset Dam, this gauge represents almost 75% of the catchment to the Dam. This gauge operated reliably and provided sufficiently accurate operational data for modelling purposes during the Event.

Figure 6.5.4 – Gauge height, Brisbane River at Gregors Creek

DRAFT ONLY - THIS DOCUMENT CONTAINS INFORMATION

Wivenhoe Dam

The manual read gauge board used during this event is located on the outside of wing wall of the spillway approach. There are two automatic gauges at Wivenhoe Dam. Sensor 6638 was marked as 'out of action' (OOA) for the Event. The other sensor 6637, located around 50m upstream of the gates, matched the manual gauge board readings until around midday on Tuesday 11 January 2011. It was at this point the large gate openings began to cause noticeable drawdown and surging in the spillway approach. The automatic lake level gauge 6637 is located within the approach and was impacted by this drawdown. This discrepancy combined with a possible sensor blockage resulted in readings, which were up to 0.8m lower than the observed manual readings during this period. It should be noted that as previously discussed, gate operations were undertaken based on the accurate manual gauge board observations. The discrepancy is shown clearly in Figure 6.5.6.

DRAFT ONLY - THIS DOCUMENT CONTAINS INFORMATION

Figure 6.5.1 Gauge height, Wivenhoe Dam, 11-13 January 2011

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHECKED OR VERIFIED INFORMATION

Lockyer Creek at Lyons Bridge

Lockyer Creek at Lyons Bridge is a key gauging station for determining outflows from Lockyer Creek into the Brisbane River. While the O'Reillys Weir gauge is located further down the catchment, it is influenced by backwater due to releases from Wivenhoe Dam. Therefore, readings from the O'Reillys Weir gauge during a large Event are not considered reliable. The Lyons Bridge gauge operated reliably and provided sufficiently accurate operational data for modelling purposes during the Event.

Figure 6.5.7 – Gauge height, Lockyer Creek at Lyons Bridge

DRAFT ONLY - THIS DOCUMENT CONTAINS PRELIMINARY INFORMATION

Brisbane River at Savages Crossing

Savages Crossing is located just downstream from the junction of the Brisbane River and Lockyer Creek. This gauge is considered to more accurately represent the combined Lockyer and Brisbane flow than the upstream station at Lowood. This gauge operated reliably and provided sufficiently accurate operational data for modelling purposes during the Event.

Figure 6.5.8 – Gauge height, Brisbane River at Savages Crossing

DRAFT ONLY - THIS DOCUMENT CONTAINS INFORMATION

Bremer River at Walloon

Walloon is a key gauging station used to determine total outflow from the Bremer River. It operated reliably and provided sufficiently accurate operational data for modelling purposes during the Event.

Figure 6.5.9 – Gauge height, Bremer River at Walloon

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CERTAIN INFORMATION

Warrill Creek at Amberley

Amberley is a key gauging station on Warrill Creek, and when combined with Walloon, it is a key gauging station used to determine total outflow from the Bremer River. This station operated reliably and provided sufficiently accurate operational data for modelling purposes during the Event.

Figure 6.5.10 – Gauge height, Warrill Creek at Amberley

DRAFT ONLY - THIS DOCUMENT CONTAINS NO COPY

Bremer River at Ipswich

Ipswich is located on the lower reaches of the Bremer just above its junction with the Brisbane River. It should be noted that water levels at this gauge are affected by backwater from high water levels in the Brisbane River. This gauge operated reliably and provided sufficiently accurate operational data for modelling purposes during the Event.

Figure 6.5.11 – Gauge height, Bremer River at Ipswich

DRAFT ONLY - THIS DOCUMENT CONTAINS INFORMATION

Brisbane River at Moggill

Moggill is the key gauging station at the junction of the Brisbane and Bremer Rivers. It represents the combined flow of these two rivers. This gauge operated reliably and provided sufficiently accurate operational data for modelling purposes during the Event.

Figure 6.5.12 – Gauge height, Brisbane River at Moggill

DRAFT ONLY - THIS DOCUMENT CONTAINS INFORMATION

Brisbane River at Port Office

The Port Office gauge has the longest flood record of any water level gauge in the Brisbane River and is the key gauging station for the Brisbane City area. This gauge operated reliably and provided sufficiently accurate operational data for modelling purposes during the Event.

Figure 6.5.13 - Gauge height, Brisbane River at Port Office

Brisbane River at Whyte Island

The Brisbane River gauge at Whyte Island is located near to the mouth of the river and records tide levels. While tide levels do not directly impact dam operations, flood levels in the Lower Brisbane River are tide dependent and the Flood Operations Centre needs to be cognisant of the tides.

Deleted: lower

During the January 2011 Flood Event, recorded tides at Whyte Island were up to 0.5m lower than the previous week.

Figure 6.5.14 – Gauge height, Brisbane River at Whyte Island

6. EVENT DATA (continued)

6.6 Dam inflows and outflows

The inflows and outflows from Somerset and Wivenhoe Dams appear in Table 6.6.1 and are shown in more detail in Section 9 and Appendix B. Dam inflow is estimated by reverse routing. Reverse routing is calculating the rate of change of the storage and adding the Dam outflow.

Formatted: Font color: Red

Item	Unit	Somerset Dam	Wivenhoe Dam*
Inflow volume	ML	825,000	2,650,000
Outflow volume	ML	820,000	2,650,000

* Wivenhoe Dam inflow figures include Somerset Dam outflows

Table 6.6.1 – Summary inflows and outflows for Somerset and Wivenhoe Dams

The inflow into Somerset Dam is characterised by dual peaks; the first peak on the afternoon of Sunday 9 January 2011 being higher than the second on the afternoon of Tuesday 11 January 2011 (nearly 48 hours apart). The peak of the outflow occurred late on Monday 10 January 2011 when five sluices were opened. These were quickly closed on the morning of Tuesday 11 January 2011 when Wivenhoe Dam levels began rising quickly. The maximum water level in Somerset Dam of 105.11m was reached on the morning of Wednesday 12 January 2011. This information is summarised in the following graph, Figure 6.6.2.

Figure 6.6.2 – Somerset Dam water levels, January 2011 Flood Event

Similar to Somerset Dam, the inflow into Wivenhoe Dam is also characterised by dual peaks. The first peak on the morning of Monday 10 January 2011 was lower than the second on the afternoon of Tuesday 11 January 2011 (30 hours apart). The peak of the outflow occurred at 19:00 on Tuesday 11 January 2011. Flow was reduced quickly later that night as the Dam water level stabilised, however it was increased again during

6 EVENT DATA (continued)

Thursday 13 January 2011 to achieve the drainage required within seven days after the flood peak passed below Moggill. The peak water level in Wivenhoe Dam of 74.97m was reached at 19:00 on Tuesday 11 January 2011. This information is summarised in the following graph, Figure 6.6.3.

Figure 6.6.3 – Wivenhoe Dam water levels, January 2011 Flood Event

6.7 Other data sources

Other decision-making support tools examined and considered in conjunction with the modelling results include:

Formatted: Font color: Gray-75%

- Flood model results (available via BoM registered user service);
- Enviromon, the BoM replacement software for FLOOD-CoI. This includes all available ALERT stations in South East Queensland, including a large number of non-Seqwater stations.

Deleted: Flood-CoI

Formatted: Font color: Gray-75%

During the Event, detailed discussions were also held with the BoM Flood Warning Centre. These discussions centred on model results, rainfall forecast information and actual and projected Dam inflows and outflows. BoM also provided Lockyer Creek and Bremer River outflows to compare against modelled results generated by the Flood Operations Centre. Generally, Flood Operations Centre modelling correlated well with BoM modelling results.

Similar discussions were held with Brisbane City Council and the Council also provided stage damage data for consideration by the Flood Operations Centre during the Event.

In addition to the sources listed above, for comparison purposes, the DERM website (www.derm.qld.gov.au) was used to examine and check river height and flow estimations at selected gauging stations.

9 DAM INFLOW AND FLOOD RELEASE DETAILS

9.1 Wivenhoe Dam

Table 9.1.1 provides full details of inflows into and releases from Wivenhoe Dam for the duration of the January 2011 Flood Event. Details of the strategies used in determining these releases and how these strategies comply with the Manual are contained in Sections 2 and 10 of this Report. Table 9.1.1 also shows the gate operation sequence was in accordance with the Manual over the duration of the Event.

Deleted: that

Some points to note in relation to Table 9.1.1 are:

Deleted: the table in

- Inflow and flood release calculations are based on manual gauge board readings shown in the table that provide the lake level. During the Event, these manual gauge board readings were provided by the Dam operators to the Flood Operations Centre on an hourly basis. Any missed readings have been interpolated from the closest available actual readings.
- Release calculations are based on the discharge rating tables contained in the Manual.
- Inflow calculations are derived using a reverse routing technique assuming level pool. For each time step, inflow is based on the rate of change of the storage calculated from the manual gauge board readings and the Dam storage curve plus the releases. The method tends to underestimate the rising limb and overestimate the falling limb of the inflow. The erratic shape of the inflow is due to small level differences resulting in large inflow volumes.
- The table shows inflow rates and releases on the hour through the event. In some instances, gate operations may have occurred between hours or at less than one-hourly intervals. In these instances, the table shows the actual gate openings as they were at the time indicated.
- The flood release from Wivenhoe Dam associated with the flood event prior to the January 2011 Flood Event was completed at 09:00 on 2 January 2011. The lake level in Wivenhoe Dam at this time was 67.10m or 0.15m below the gate opening trigger level. At this level, 16,250ML of inflow is needed before trigger level is reached. Following gate closure, the Dam continued to release over 4,000ML per day to account for base flow into the dam from the previous flood event, with the expectation being that the dam would slowly fall below FSL in the days following 2 January 2011. However, due to rainfall and further dam inflows, the lake level rose steadily after 2 January 2011 and was above gate trigger level at the commencement of the event. However in accordance with Strategy W1 and the intent of that Strategy, releases did not immediately commence to ensure that bridges downstream of the dam were not prematurely submerged.

Table 9.1.1 – Wivenhoe Dam inflow and release data for the January 2011 Flood Event

A summary of the data in Table 9.1.1 is illustrated in Figure 9.1.2. The considerable flood mitigation benefits provided by Wivenhoe Dam over the duration of the Event is clearly demonstrated in Figure 9.1.2 and can be seen in considerable differences between Dam inflow and outflow.

**Wivenhoe Dam - January 2011 Flood Event
(Dam Inflow and Flood Release Summary)**

Figure 9.1.2 -- Wivenhoe Dam inflow and release summary for the January 2011 Flood Event

9.2 Somerset Dam

Table 9.2.1 provides full details of inflows into and releases from Somerset Dam over the duration of the Flood Event. Details of the strategies used in determining these releases and how these strategies comply with the Manual are contained in Section 7 of this Report. Table 9.2.1 also shows the gate operation sequence was in accordance with the Manual over the duration of the Event.

Some points to note in relation to Table 9.2.1 are:

Deleted: the table in

- Inflow and flood release calculations are based on manual gauge board readings shown in the table that provide the lake level. During the Event, these manual gauge board readings were normally provided by the Dam operators to the Flood Operations Centre on an hourly basis. However, with prior approval from the Flood Operations Centre, during non-critical periods, the operators occasionally would miss a reading to complete higher priority site activities. In these instances, the table value has been interpolated from the closest available actual readings.
- Release calculations use the discharge rating formulae contained in the Manual.
- Inflow calculations are derived using a reverse routing technique assuming level pool. For each time step, inflow is based on the rate of change of the storage calculated from the manual gauge board readings and the Dam storage curve plus the releases. The method tends to underestimate the rising limb and overestimate the falling limb of the inflow. The erratic shape of the inflow is due to small level differences resulting in large inflow volumes.
- The table shows inflow rates and releases on the hour through the event. In some instances, gate operations may have occurred between hours or at less than one hourly intervals. In these instances, the table shows the actual gate openings as there were at the time indicated.
- The flood release from Somerset Dam associated with the flood event prior to the January 2011 Flood Event was completed at 13:00 on 31 December 2010. The lake level in Somerset Dam at this time was 98.99m or 0.01m below the FSL. The Dam continued to release 3,000ML per day to account for base flow into the dam from the previous flood event, with the expectation being that the dam would slowly fall below FSL in the days following 31 December 2010. However, due to rainfall and further dam inflows, the lake level rose steadily after 31 December 2010 and was above FSL at the commencement of the event.

Table 9.2.1 – Somerset Dam inflow and release data for the January 2011 Flood Event

Figure 9.2.2 – Somerset Dam inflow and release summary for the January 2011 Flood Event

DRAFT ONLY - THIS IS A

9.3 Inflow Volumes

Figure 9.3.1 shows the increase in inflow volume in both Dams over the duration of the Event. The total combined inflow for the Event was 2,650,000ML between 2 and 19 January 2011. Of this total, nearly 820,000ML was generated in the Stanley River to Somerset Dam catchment while the remaining 1,830,000ML was generated in the Upper Brisbane River catchment.

Deleted: e
Deleted: was

The Somerset Dam catchment accounts for slightly less than 20% of the total Wivenhoe catchment, but nearly 31% of the Event runoff was generated in this catchment.

Figure 9.3.1 – Event inflow volume

DRAFT ONLY - THIS DOCUMENT IS FOR INFORMATION ONLY

9 DAM INFLOW AND FLOOD RELEASE DETAILS (continued)

Figure 9.3.2 shows the cumulative inflow volume of the Event over its duration. At 13:00 on 9 January 2011, only 13% of the Event inflow volume had been generated. Within the relatively short space of two and a half days, this had increased to nearly 70% of the total Event inflow volume.

Figure 9.3.2 – Total Event inflow volume

DRAFT ONLY - THIS DOCUMENT CONTAINS

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE

10.1 Manual objectives

Formatted: Bullets and Numbering

Flood events that impact Somerset Dam and Wivenhoe Dam are caused by rainfall events that vary in intensity, duration and distribution over a catchment area exceeding 7,000km² above the Dams. When making decisions about releasing water from the Dams during flood events, consideration is also given to rain falling in Brisbane River catchment areas not controlled by the Dams. These catchment areas, which include the Lockyer Creek and Bremer River catchments, also cover an area in the order of 7,000km² and rain falling in these catchments will also vary in intensity, duration and distribution. Accordingly, the Manual must account for an infinite number of flood event scenarios.

The current level of forecasting technology does not make it possible for the Bureau of Meteorology (BoM) to provide completely accurate rainfall forecasts for the Dam catchment areas. A degree of uncertainty exists in all weather forecasts and the further forward in time forecasts are provided, the greater the degree of uncertainty.

As it is not possible to provide a specific procedure for Dam operation during every possible flood event, the Manual takes the approach of providing objectives and strategies to guide operational decision-making during a flood event. The objective followed and strategy chosen at any point in time depends on the actual water levels in the Dams as well as flood modelling predictions based on the best observed and forecast rainfall and stream flow information available at the time.

It is not possible to predict the range of objectives and strategies that will be used during the course of a flood event, before or at any time during the event, prior to the event peak. Objectives and strategies change as flood events progress, as rainfall is received in the catchment and as forecast rainfall amounts change. For small floods, objectives and strategies relate to minimising flood impacts in rural areas, while as the scale of the flood increases, the emphasis changes to protecting urban areas and maintaining the structural safety of the Dam.

The primary objectives of the Manual, in order of importance, are:

- Ensure the structural safety of the Dams;
- Provide optimum protection of urbanised areas from inundation;
- Minimise disruption to rural life in the Valleys of the Brisbane and Stanley Rivers;
- Retain the storage at Full Supply Level (FSL) at the conclusion of the flood event;
- Minimise impacts to riparian flora and fauna during the drain down phase of the flood event.

Formatted: Bullets and Numbering

While ensuring the Dams are operated during flood events within these objectives, Seqwater's duty of care to the public is also a primary consideration when making flood releases from the Dams. Every attempt is made to ensure public roads are closed prior to inundation by Dam outflows and that authorities are provided with enough time to prepare for community isolations and to undertake evacuations. These actions are in accordance with draft Communication Protocol prepared by the Department of Environment and Resource Management to ensure information is effectively communicated to the public during flood events impacting the Dams. Every attempt is also made to ensure urban damage is minimised, and that Dam outflows with the potential to contribute to urban damage are delayed until it is apparent no other options are available without risking the safety of the Dams.

Formatted: Normal

10.2 Wivenhoe Dam flood mitigation strategies

Wivenhoe Dam is capable of being operated in a number of ways to reduce flooding in the Brisbane River downstream of the Dam, depending on the origin, magnitude and spatial extent of the rainfall. Maximum overall flood mitigation effect is achieved by operating Wivenhoe Dam in conjunction with Somerset Dam.

Deleted: flood

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE (continued)

There are four strategies (W1 to W4) used when operating Wivenhoe Dam during a flood event. The strategy chosen at any point in time depends on the actual levels in the Dams and the following predictions, which are to be made using the best recorded and forecast rainfall and stream flow information available at the time:

- Maximum storage levels in Wivenhoe and Somerset Dams;
- Peak flow rate at the Lowood gauge (excluding Wivenhoe Dam releases);
- Peak flow rate at the Moggill gauge (excluding Wivenhoe Dam releases).

Strategies change during a flood event as rain is received in the catchments and forecasts change. It is not possible to predict the range of strategies that will be used during the course of a flood event at the commencement of the event. Strategies are changed in response to changing rainfall forecasts and stream flow conditions to maximise the flood mitigation benefits of the Dams.

The four Strategies (W1 to W4) used when operating Wivenhoe Dam during a flood event are summarised below.

Strategy W1 - The primary consideration is minimising disruption to downstream rural life

Conditions
<ul style="list-style-type: none"> • Wivenhoe storage level predicted to be less than 68.50m • Maximum release predicted to be less than 1,900m³/s • The primary consideration is minimising disruption to downstream rural life

Strategy W1 intends to ensure the seven bridges between the Dam and Moggill are not submerged prematurely. The limiting condition for Strategy W1 is the submergence of Mt Crosby Weir Bridge which occurs at approximately 1,900m³/s.

This strategy requires a great deal of control over releases and knowledge of discharges from Lockyer Creek. In general, the releases from Wivenhoe Dam are controlled to ensure the combined flow from Lockyer Creek and Wivenhoe Dam is less than the limiting values to delay the submergence of a particular bridge.

Strategy W2 - A transition strategy where the primary consideration changes from minimising impact to downstream rural life to protecting urban areas from inundation.

Conditions
<ul style="list-style-type: none"> • Wivenhoe storage level predicted to be between 68.50m and 74.00m • Maximum release predicted to be less than 3,500m³/s <p>This is a transition strategy in which the primary consideration changes from minimising disruption to downstream rural life to protecting urban areas from inundation</p> <ul style="list-style-type: none"> • Lower level objectives are still considered when making decisions on water releases. Objectives are always considered in order of importance

Strategy W2 intends to limit the flow in the Brisbane River to less than the naturally occurring peaks at Lowood and Moggill, while remaining within the upper limit of non-damaging floods at Lowood (3,500m³/s).

Strategy W3 - The primary consideration is protecting urban areas from inundation

Conditions
<ul style="list-style-type: none"> • Wivenhoe storage level predicted to be between 68.50m and 74.00m • Maximum release should not exceed 4,000m³/s • The primary consideration is protecting urban areas from inundation • Lower level objectives are still considered when making decisions on water releases. Objectives are always considered in order of importance

Deleted: These strategies are based on the Flood Objectives of the Manual. These objectives, listed in descending order of importance, are as follows:¶
 <#>Ensure the structural safety of the Dams;¶
 <#>Provide optimum protection of urbanised areas from inundation;¶
 <#>Minimise disruption to rural life in the valleys of the Brisbane and Stanley Rivers;¶
 <#>Retain the storage at Full Supply Level at the conclusion of the Flood Event;¶
 <#>Minimise impacts to riparian flora and fauna during the drain down phase of the Flood Event.¶
 When using any of the four strategies, consideration is always given to these objectives in this order, when making decisions on Dam releases.¶

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE (continued)

Strategy W3 intends to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s, noting that 4,000m³/s at Moggill is the upper limit of non-damaging floods downstream defined in the Manual. The combined peak river flow targets for Strategy W3 are shown in the table below. In relation to these targets, it should be noted that, depending on natural flows from the Lockyer and Bremer catchments, it may not be possible to limit the flow at Moggill to below 4,000m³/s. In these instances, the flow at Moggill is to be kept as low as possible.

Timing	Target maximum flow in the Brisbane River
Prior to the naturally occurring peak at Moggill (excluding Wivenhoe Dam releases).	The flow at Moggill is to be minimised.
After the naturally occurring peak at Moggill (excluding Wivenhoe Dam releases).	The flow at Moggill is to be lowered to 4,000m ³ /s as soon as possible.

Strategy W4 – The primary consideration is protecting the structural safety of the Dam	
Conditions	<ul style="list-style-type: none"> Wivenhoe storage level predicted to exceed 74.00m No limit on maximum release rate The primary consideration is protecting the structural safety of the Dam Lower level objectives are still considered when making decisions on water releases. Objectives are always considered in order of importance

Strategy W4 intends to ensure the safety of the Dam while limiting downstream impacts as much as possible. This strategy generally comes into effect when the water level in Wivenhoe Dam reaches 74.0m. However, the Senior Flood Operations Engineer may seek to invoke the discretionary powers of Section 2.8 if the earlier commencement of Strategy W4 is able to prevent a fuse plug being triggered.

Under Strategy W4, the release rate is increased as the safety of the Dam becomes the priority. The gates are generally opened until the storage level of Wivenhoe Dam begins to fall. There are no restrictions on gate opening increments or gate operating frequency once the storage level exceeds 74.0m, as the safety of the Dam is of primary concern at these storage levels.

10.3 Somerset Dam flood mitigation strategies

Somerset Dam is capable of being operated in a number of ways to regulate Stanley River floods. Somerset Dam and Wivenhoe Dam are to be operated in conjunction to optimise the flood mitigation benefits downstream of Wivenhoe Dam. Once a flood event is declared, an assessment is made of the magnitude of the flood event, including a prediction of the maximum storage levels in Somerset and Wivenhoe Dams.

Three strategies, based on the objectives of the Manual, are used when operating Somerset Dam during a flood event. The strategy selected at any point in time depends on predictions of the maximum storage levels in Somerset and Wivenhoe Dams, made using the best actual and forecast rainfall and stream flow information available at the time.

Strategies are likely to change during a flood event as rain is received in the catchments and forecasts change. It is not possible to predict the range of strategies that will be used during the course of a flood event when the event begins. Strategies are changed in response to changing rainfall and stream flow conditions to maximise the flood mitigation benefits of the Dams.

The three Strategies (S1 to S3) used when operating Somerset Dam during a flood event are summarised below.

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE (continued)

Strategy S1 – Minimising impact on rural life upstream

- | | |
|-------------------|---|
| Conditions | <ul style="list-style-type: none"> Somerset Dam level expected to exceed 99.0m and Wivenhoe Dam not expected to reach 67.0m (FSL) during the course of the flood event |
|-------------------|---|

Strategy S1 intends to return the Dam to full supply level while minimising the impact on rural life upstream of the Dam. Consideration is also given to minimising the downstream environmental impacts from the release.

The crest gates at Somerset Dam are raised to enable uncontrolled discharge. The regulator valves and sluice gates are to be used to maintain the level in Somerset Dam below 102.0m (deck level of Mary Smokes Bridge). The Somerset Dam release rate is not to exceed the peak inflow into the Dam.

Deleted: ¶

Strategy S2 – Minimise impacts below Wivenhoe Dam

- | | |
|-------------------|--|
| Conditions | <ul style="list-style-type: none"> Somerset Dam level expected to exceed 99.0m and Wivenhoe Dam level expected to exceed 67.0m (FSL) but not exceed 75.5m (fuse plug initiation) during the course of the flood event |
|-------------------|--|

Strategy S2 intends to maximise the benefits of the flood storage capabilities of the Dam, while protecting the structural safety of both Dams. Table 10.2.1 contains the operating conditions and actions for Strategy S2.

Deleted: 2

Condition	Action
Wivenhoe Dam rising and Somerset level below 100.45m	<ul style="list-style-type: none"> The crest gates are raised to enable uncontrolled discharge The low-level regulators and sluices are generally kept closed
Wivenhoe Dam rising and Somerset level above 100.45m	<ul style="list-style-type: none"> The crest gates are raised to enable uncontrolled discharge Operations aim to achieve a correlation of water levels in Somerset Dam and Wivenhoe Dam, as set out in Figure 10.2.2. The Operating Target Line shown on this graph is to generally be followed as the flood event progresses The release rate from Somerset Dam is generally not to exceed the peak inflow into the Dam
Wivenhoe Dam falling and Somerset level above 100.45m	<ul style="list-style-type: none"> The opening of the regulators and sluices generally should not cause Wivenhoe Dam to rise significantly The release rate from Somerset Dam is generally not to exceed the peak inflow into the Dam
The flood event has emanated mainly from the Stanley River catchment without significant runoff in the Upper Brisbane River catchment	<ul style="list-style-type: none"> The crest gates at Somerset Dam are raised to enable uncontrolled discharge The regulator valves and sluice gates are to be used to maintain the level in Somerset Dam below 102.0m (deck level of Mary Smokes Bridge) The release rate from Somerset Dam is generally not to exceed the peak inflow into the Dam.

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE (continued)

Figure 10.2.2 Strategy S2, Wivenhoe / Somerset Operating Target Line

Deleted: 3

Deleted: 3

Notes on Figure 10.2.2:

- The Operating Target Line was selected following an optimisation study and considering the following factors:
 - Equal minimisation of flood level peaks in both Dams in relation to their associated Dam failure levels;
 - Minimisation of flows in the Brisbane River downstream of Wivenhoe Dam;
 - Consideration of the time needed at the onset of a flood event to properly assess the magnitude of the event and the likely impacts. This is to ensure the optimal strategy to maximise the flood mitigation benefits of the storages can be selected.
- The target point on the Operating Target Line at any point in time is based on the maximum storage levels in Somerset and Wivenhoe Dams, using the best forecast rainfall and stream flow information available at the time.
- Gate operations enable the progressive movement of the duty point towards the target line. It is not necessarily possible to adjust the duty point directly towards the target line in a single gate operation.

Strategy S3 - Protect the structural safety of the Dam	
Conditions	<ul style="list-style-type: none"> Somerset Dam level expected to exceed 99.0m and Wivenhoe Dam level expected to exceed the fuse plug initiation level during the course of the flood event.

Deleted: 75.5m (

Deleted:)

Strategy S3 intends to maximise the benefits of the flood storage capabilities of the Dam while protecting the structural safety of both Dams. In addition to the operating protocols used in Strategy S2 to prevent fuse plug initiation, consideration can be given to temporary departure from the operating protocols contained in this strategy under the following conditions:

- The safety of Somerset Dam is the primary consideration and cannot be compromised;
- The peak level in Somerset Dam cannot exceed 109.7m.

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE (continued)

10.4 Wivenhoe Dam – Manual compliance

Table 10.3.1 summarises the strategies used in the operation of Wivenhoe Dam during the January 2011 Flood Event and provides explanations of how the use of these strategies complies with the Manual.

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE (continued)

Period	Strategies used during the period	Explanation of strategies used during the period	Manual requirements	
Commenced Friday 07 Jan 2011 15:00 (Lake level 68.03m) Completed Friday 07 Jan 2011 22:00 (Lake level 68.26m)	Strategy W1D	<ul style="list-style-type: none"> The strategy transitioned from Strategy W1C to Strategy W1D once the lake level exceeded 68.00m. At the start of this period, it became apparent Kholo Bridge would be inundated by natural Brisbane River flows (excluding Wivenhoe Dam releases). Based on flows recorded at Mt Crosby Weir, Kholo Bridge was inundated near the end of this period (middle of the night). Therefore, the strategy adopted was to close Kholo Bridge in daylight hours for public safety, and then assume – for the purposes of Strategy W1D – that Kholo Bridge was closed to traffic. 	Use Strategy W1D when the lake level is between 68.00m and 68.25m. (Maximum release 1,900m ³ /s)	Deleted: L Deleted: L Deleted: [Deleted:] Deleted: Lake
		<ul style="list-style-type: none"> Accordingly, the strategy during this period was to keep Mt Crosby Weir Bridge trafficable by limiting the combined flows from Wivenhoe Dam and Lockyer Creek to a maximum of 1,900m³/s. During this period, releases were increased from 50m³/s to 403m³/s. Radial gates were opened continuously at Wivenhoe Dam, in accordance with the standard gate opening sequence at a rate of 0.5 metres of individual gate opening per hour. Mt Crosby Weir Bridge remained trafficable during the period. The strategy transitioned from Strategy W1D to Strategy W1E once the lake level exceeded 68.25m. 	Under Strategy W1D, the Manual requires that once Kholo Bridge is closed to traffic, endeavour to keep Mt Crosby Weir Bridge trafficable by limiting the combined flows from Wivenhoe Dam and Lockyer Creek to a maximum of 1,900m ³ /s. Use Strategy W1E when the lake level is between 68.25m and 68.50m. 10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE (continued)

Period	Strategies used during the period	Explanation of strategies used during the period	Manual requirements
<p>Commenced Saturday 08 Jan 2011 08:00 (Lake level 68.52m)</p> <p>Completed Sunday 09 Jan 2011 08:00 (Lake level 68.56m)</p>	<p>Strategy W3</p>	<ul style="list-style-type: none"> The lake level at the start of this period was 68.52m and the release rate from the Dam was 927m³/s. The lake level at the end of this period was 68.56m and the release rate from the Dam was 1,334m³/s. The lake level rose 40mm during this 24-hour period. The catchment average rainfall experienced in the Wivenhoe Dam catchment (excluding the Somerset Dam catchment) during this 24-hour period was 21mm. The latest QPF forecast available at the end of this period was for 40mm in the Dam catchments in the next 24 hours (issued at 16:00 on 8 January 2011). At the end of this period, model results estimated the Wivenhoe Dam peak at 68.7m (excluding forecast) and 69.3m (including forecast). The estimated peak of 69.3m (including forecast) had previously been exceeded in March 1989, April 1989, February 1999, October 2010 and December 2010. On each of these occasions, no known urban damage had occurred downstream of Moggill as a result of Dam releases. At the end of this period, model results estimate total Dam inflow at 569,000ML (excluding forecast) and 814,000ML (including forecast). The estimated total Dam inflow of 814,000ML (including forecast) on a full Dam had previously been exceeded in April 1989 and February 1999. On each of these occasions, no known urban damage had occurred downstream of Moggill as a result of Dam releases. Estimated peak flow at Moggill (including Wivenhoe Dam releases) was 1,720m³/s (excluding forecast) and 2,220m³/s (including forecast). On the basis of the information above, the available data did not indicate there would be a need to increase releases from Wivenhoe Dam above the current modelled levels to protect urban areas from inundation, either during the current period or in the 24 hours following the current period. The naturally occurring peak at Moggill was estimated to have occurred at 05:00 on 08 January 2011 (i.e. in the past). Strategy W3 requires the flow at Moggill to be lowered to 4,000m³/s as soon as possible after the naturally occurring peak at Moggill (excluding Wivenhoe Dam releases). This was already achieved. Strategy W3 also requires consideration of lower level Manual objectives, and on the basis of this requirement, consideration during this period was given to minimising disruption to downstream rural life and endeavouring to keep Mt Crosby Weir Bridge and Fernvale Bridge trafficable. <u>Wivenhoe Dam outflows were more than doubling the natural peak flows at Moggill. Increasing releases from Wivenhoe Dam to produce a flow rate at Moggill of up to 3,000m³/s would have meant transitioning back to operating Strategy W1 in around 18 hours from this time. Therefore, increasing Dam releases could not be justified given the resulting impacts such a flow would have downstream, especially on localised flooding in Brisbane.</u> 	<p>Use Strategy W3 when the intent of Strategy W2 cannot be met and the lake level is predicted to be between 68.50m and 74.00m. (Maximum release 4,000m³/s)</p> <p>The primary consideration is protecting urban areas from inundation, however the Manual also requires lower level objectives to be considered when making decisions on water releases. Objectives are always considered in order of importance.</p> <p>The intent of Strategy W3 is to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s.</p> <p>After the naturally occurring peak at Moggill (excluding Wivenhoe Dam releases), the flow at Moggill is to be lowered to 4,000 m³/s as soon as possible.</p>

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE (continued)

Period	Strategies used during the period	Explanation of strategies used during the period	Manual requirements
Commenced Sunday 09 Jan 2011 08:00 (Lake level 68.58m)	Strategy W3	<ul style="list-style-type: none"> The Lake level at the start of this period was 68.56m and the release rate from the Dam was 1,334m³/s. The Lake level at the end of this period was 68.97m and the release rate from the Dam was 1,411m³/s. The Lake level rose 410mm during this 11-hour period. The catchment average rainfall experienced in the Wivenhoe Dam catchment (excluding the Somerset Dam catchment) during this 24-hour period was 96mm, the bulk of which (62mm) occurred in the last five hours of the period. 	Use Strategy W3 when the intent of Strategy W2 cannot be met and the Lake level is predicted to be between 68.50m and 74.00m. [Maximum release 4,000m ³ /s]
Completed Sunday 09 Jan 2011 19:00 (Lake level 68.97m)		<ul style="list-style-type: none"> The latest QPF forecast available at the end of this period was for 65mm in the Dam catchments in the next 24 hours (issued at 16:00 on 9 January 2011). At the mid-point of this period (14:00), model results estimated Wivenhoe Dam to peak at 70.0m (excluding forecast) and 71.3m (including forecast). The estimated peak of 71.3m (including forecast) had previously been exceeded in April 1989, and on this occasion, no known urban damage had occurred downstream of Moggill as a result of Dam releases. At the mid-point of this period (14:00), model results estimated total Dam inflow at 804,000ML (excluding forecast) and 1,108,000ML (including forecast). The estimated total Dam inflow of 1,108,000ML (including forecast) – on a full Dam – had never previously been exceeded, with the previous largest volumes being 870,000ML in April 1989 and 925,000 in February 1999. Although the inflow estimate of 1,108,000ML was based on a forecast, it resulted in an expectation that there may be a need within the next six hours to transition to a situation where minimising disruption to downstream rural life was no longer considered. This would result in the closure of all bridges between the Dam and Moggill, and the closure of Brisbane Valley Highway. At the mid-point of this period (14:00), estimated peak flow at Moggill (including Wivenhoe Dam releases) was 1,850m³/s (excluding forecast) and 2,590m³/s (including forecast). On the basis of the information above, the available data at the mid-point of this period did not indicate there would be a definite need to increase releases from Wivenhoe Dam above the current modelled levels to protect urban areas from inundation in the six hours from 14:00. At the end of this period, model results estimated Wivenhoe Dam to peak at 72.1m (excluding forecast) and 73.9m (including forecast). These values had never been previously exceeded. At the end of this period, model results estimated total Dam inflow at 1,272,000ML (excluding forecast) and 1,712,000ML (including forecast). These values had never been previously exceeded. On the basis of the estimated Wivenhoe Dam peak levels and inflow volumes from the model results undertaken towards the end of this period, the decision was made at 19:00 on 09 January 2011 to transition to a situation where minimising disruption to downstream rural life was no longer a consideration. 	<p>The primary consideration is protecting urban areas from inundation, however the Manual also requires lower level objectives to be considered when making decisions on water releases. Objectives are always considered in order of importance.</p> <p>The intent of Strategy W3 is to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s.</p> <p>After the naturally occurring peak at Moggill (excluding Wivenhoe Dam releases), the flow at Moggill is to be lowered to 4,000m³/s as soon as possible.</p>

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE (continued)

Period	Strategies used during the period	Explanation of strategies used during the period	Manual requirements
<p>Commenced Sunday 09 Jan 2011 19:00 (Lake level 68.97m)</p> <p>Completed Tuesday 11 Jan 2011 08:00 (Lake level 73.70m)</p>	<p>Strategy W3</p>	<ul style="list-style-type: none"> On the basis of the information contained in the previous table, at the start of this period, it was decided to transition to a situation where minimising disruption to downstream rural life was no longer considered. The lake level at the start of this period was 68.97m and the release rate from the Dam was 1,411m³/s. The lake level at the end of this period was 73.70m and the release rate from the Dam was 2,753m³/s. The lake level rose 4,730mm during this 37-hour period. The catchment average rainfall experienced in the Wivenhoe Dam catchment (excluding Somerset Dam catchment) during this 24-hour period was 115mm, the bulk of which (77mm) occurred in the last twelve hours of this 37-hour period. The latest QPF forecast available at the end of this period was for 65mm in the Dam catchments in the next 24 hours (issued at 16:00 on 10 January 2011). By two thirds of the way through this period (20:00, 10 January 2011), model results estimated Wivenhoe Dam to peak at 73.6m (excluding forecast) and 74.3m (including forecast). A discussion with the Dam Safety Regulator was held at 21:00 to obtain permission to exceed a level of 74.0m in Wivenhoe Dam for a short period without invoking Strategy W4 (provided the safety of the Dam could be guaranteed). This issue was considered carefully at all times during the period in view of the continued rainfall. At 04:00 on 11 January 2011, a period of intense rainfall commenced within the Wivenhoe Dam catchment area. By 08:00, model results estimated Wivenhoe Dam would peak at 74.5m (excluding forecast) and 75.1m (including forecast). A decision was made to transition to Strategy W4 and the Dam Safety Regulator, Seqwater CEO and the Councils were advised of this decision. The Wivenhoe lake level was 73.70m. 	<p>Use Strategy W3 when the intent of Strategy W2 cannot be met and the lake level is predicted to be between 68.50m and 74.00m. (Maximum release 4,000m³/s).</p> <p>The primary consideration is protecting urban areas from inundation, however the Manual also requires lower level objectives to still be considered when making decisions on water releases. Objectives are always considered in order of importance.</p> <p>The intent of Strategy W3 is to limit the flow in the Brisbane River at Moggill to less than 4,000m³/s.</p> <p>After the naturally occurring peak at Moggill (excluding Wivenhoe Dam releases), the flow at Moggill is to be lowered to 4,000m³/s as soon as possible.</p> <p>Use Strategy W4 when Wivenhoe Dam's storage level is likely to exceed 74.00m. (No limit on maximum release rate).</p> <p>The primary consideration of Strategy W4 is to protect the structural safety of the Dam, however lower level objectives are still considered in order of importance when making decisions on water releases.</p> <p>Under Strategy W4, gates are opened until the storage level of Wivenhoe Dam begins to fall.</p>

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE (continued)

Period	Strategies used during the period	Explanation of strategies used during the period	Manual requirements
Commenced Tuesday 11 Jan 2011 08:00 (Lake level 73.70m)	Strategy W4	<ul style="list-style-type: none"> On the basis of the information contained in the previous table, at the start of this period it was decided to transition to Strategy W4. The lake level at the start of this period was 73.70m and the release rate from the Dam was 2,753m³/s. The lake level at the end of this period was 74.61m and the release rate from the Dam was 2,534m³/s. During this period, at 19:00 on 11 January 2011, the lake level peaked at 74.97m and the release rate peaked at 7,464m³/s. 	Use Strategy W4 when Wivenhoe Dam's storage level is likely to exceed 74.00m. (No limit on maximum release rate).
Completed Thursday 13 Jan 2011 12:00 (Lake level 74.61m)		<ul style="list-style-type: none"> The lake level stabilised at 20:00 on 11 January 2011 and then dropped slightly at 21:00. A decision was made at 21:00 to commence closing the gates as quickly as possible to reduce urban flood impacts. This decision was made in an attempt to minimise urban damage below Moggill, which is an objective that must be considered under Strategy W4. Gates would have been re-opened if further lake level rises were experienced. Following a decision to close the gates, it was calculated that reducing to a discharge of 2,547m³/s from Wivenhoe Dam would: <ul style="list-style-type: none"> Not increase the downstream flood peak; Not cause the water level in Wivenhoe Dam to rise; and Allow the dam to be drained back to FSL in seven days in accordance with the Manual. On this basis, this target release rate was adopted. At the end of this period, it was apparent the flood peak had passed and therefore the operational strategy transitioned to the drain down phase 	<p>The primary consideration of Strategy W4 is to protect the structural safety of the Dam, however lower level objectives are still considered in order of importance when making decisions on water releases.</p> <p>Under Strategy W4, gates are opened until the storage level of Wivenhoe Dam begins to fall.</p> <p><u>The Manual states that rapid closure of radial gates is permissible when there is a requirement to reduce downstream flooding.</u></p> <p>Drain down operations require stored floodwaters to be emptied from the Dams within seven days of the flood event peak passing through the Dams.</p>

DRAFT ONLY - THIS DOCUMENT CONTAINS SENSITIVE INFORMATION

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE (continued)

10.5 Somerset Dam – Manual compliance

The table that commences on the following page (Table 10.4.2) summarises the strategies used to operate Somerset Dam during the January 2011 Flood Event, and outlines how the use of these strategies complies with the Manual.

Deleted: Wivenhoe

A graph showing the track of the Wivenhoe / Somerset Operating Target Line over the course of the Event is shown at the end of the Table 10.4.3. The Dam levels tracked very close to and on the line, in the hours leading up to and following the Event peak at 19:00 on 11 January 2011. This is demonstrated in Table 10.4.1.

Date	Actual Dam level coordinates		Interaction line coordinates		Comments

Table 10.4.1 – Somerset Dam levels as tracking against the Wivenhoe / Somerset Operating Target Line for the January 2011 Flood Event

10 FLOOD MANAGEMENT STRATEGIES AND MANUAL COMPLIANCE (continued)

Period	Strategies used during the period	Explanation of strategies used during the period	Manual requirements
Commenced Thursday 06 Jan 2011 07:42 (Lake level 99.34m) Completed Friday 07 Jan 2011 17:00 (Lake level 100.06m)	Strategy S2	<ul style="list-style-type: none"> During this nine-hour period, the Wivenhoe Dam level was rising (67.31m at the start of the period, rising to 68.03m by the end of the period) and the Somerset Dam level was below 100.45m. In accordance with Strategy S2, the crest gates at Somerset Dam were raised at the start of the Event to enable uncontrolled discharge, and the low-level sluices were kept closed. Some regulated releases continued from December as part of previous event drain down, (in the order of 35m³/s) and these continued during this period. 	<p>Use Strategy S2 when the Somerset Dam level is expected to exceed 99.0m and the Wivenhoe Dam level is expected to exceed 67.0m but not exceed 75.5m (fuse plug initiation) during the course of the event.</p> <p>If Wivenhoe Dam is rising and the Somerset Dam level is below 100.45m, Strategy S2 requires the crest gates to be raised, and the low-level regulators and sluices are generally kept closed.</p>
Commenced Thursday 07 Jan 2011 17:00 (Lake level 100.06m) Completed Friday 08 Jan 2011 07:00 (Lake level 100.44m)	Strategy S2	<ul style="list-style-type: none"> During this 15-hour period, the Wivenhoe Dam level was rising (68.03m at the start of the period, rising to 68.48m by the end of the period) and the Somerset Dam level was below 100.45m. At 17:00, it was apparent that unless releases began at Somerset Dam, the Somerset Lake level would exceed 100.45m within 12 hours. Accordingly, one sluice gate was opened during this period to allow Dam levels to move towards the Wivenhoe/Somerset Operating Target Line. 	<p>Use Strategy S2 when the Somerset Dam level is expected to exceed 99.0m and the Wivenhoe Dam level is expected to exceed 67.0m but not exceed 75.5m (fuse plug initiation) during the course of the event.</p> <p>If Wivenhoe Dam is rising and the Somerset Dam level is below 100.45m, Strategy S2 requires the crest gates to be raised, and the low-level regulators and sluices are generally kept closed.</p>

Figure 10.4.3 – Wivenhoe / Somerset Operating Target Line throughout the January 2011 Flood Event

11 EVENT COMMUNICATION

Queensland's disaster management response is provided at a local, district and State level by various, specialist agencies. This collaborative approach ensures the effective and timely coordination of information and support services state-wide.

Disaster management and hazard-specific response plans provide details of arrangements and processes to be followed at times of crisis. They also identify the need for all public communication to be coordinated during these critical times.

Deleted: and

Following the flood event impacting Somerset and Wivenhoe Dams in October 2010, a draft Communication Protocol ("the Protocol") was developed by the Department of Environment and Resource Management (DERM) to ensure effective communication between local, State and Commonwealth agencies impacted by the release of floodwater from the Dams. Its aim is to ensure consistent, harmonised information is successfully communicated to the public during flood events.

Deleted: ("the Protocol")

Deleted: the

Deleted: The Communication Protocol is designed

Deleted: effectively

The Protocol outlines the communication processes to be followed during flood events by the following agencies:

- Brisbane City Council;
- Ipswich City Council;
- Somerset Regional Council;
- Seqwater;
- Water Grid Manager;
- Queensland Police Service;
- Department of Community Safety;
- DERM;
- Department of Premier and Cabinet;
- Bureau of Meteorology (BoM).

Deleted: Department of Environment and Resource Management

The Protocol divides the communication process into three key stages:

1. Monitoring and assessment;
2. Briefing and activation;
3. Public communications.

Deleted: ;

The application of the Protocol to the January 2011 Flood Event is summarised below.

1. Monitoring and assessment

During the January 2011 Flood Event, all information communicated to the public, including information about floodwater releases from Wivenhoe Dam, was based upon a continuous process of monitoring and technical assessment of the developing situation. During the Event, Seqwater understands the following monitoring and assessment activities were undertaken by external agencies, in accordance with the Protocol:

Deleted: flood

Deleted: -

Deleted: i

Deleted: -

Deleted: January 2011 Flood

Deleted: that

Deleted: external to Seqwater

Deleted: draft

Deleted: via

Deleted: Bureau of Meteorology (

Deleted:)

Deleted: , to share modelling results

Deleted: upon

Deleted: were based

- Weather events and Dam levels were routinely monitored by relevant agencies using established systems and procedures.

- The BoM was the primary agency responsible for providing weather forecasts and warnings to the public. BoM participated in technical discussions and shared modelling results with Seqwater, Brisbane City Council, Ipswich City Council and Somerset Regional Council as necessary. These discussions lead to the development of a technical agreement around the flood situation, which formed the basis for all public communications.

- Councils monitored creek levels, local runoff and flash flooding within their areas of responsibility.

11 EVENT COMMUNICATION (continued)

- Councils with the necessary resources and expertise undertook modelling, formed predictions, identified flood inundation areas, assessed impacts for their communities and shared this information with relevant stakeholders. Councils without the necessary resources and expertise relied on information they received from other agencies to complete the impact assessment for their communities.
- Technical staff from relevant agencies held regular teleconferences to clarify and agree modelling inputs and results. Regular teleconferences were held between Seqwater and BoM.

To support the activities undertaken by external agencies, and in accordance with the Protocol, Seqwater:

- Modelled implications of the inflows on the necessary floodwater release from Somerset Dam and/or Wivenhoe Dam. (The floodwater release strategy balances releasing water from the Dams quickly enough to ensure the flood storage capacity is available if another major rain event occurs, and minimising downstream flooding impacts to people and property.)
- Calculated floodwater releases according to the Manual and regularly provided actual and projected release information to BoM and Brisbane City Council. The dates and times of when this information was provided are shown in Table 11.1.1 below. BoM used this information to model the Brisbane River catchment and its river systems.

Date/time of issue	Date/time of issue	Date/time of issue
07/01/2011 10:23	10/01/2011 13:56	11/01/2011 22:00
08/01/2011 14:58	11/01/2011 05:48	12/01/2011 03:48
09/01/2011 08:44	11/01/2011 08:06	12/01/2011 05:51
09/01/2011 17:55	11/01/2011 11:32	12/01/2011 18:07
09/01/2011 21:08	11/01/2011 13:28	12/01/2011 20:10

10/01/2011 09:07	11/01/2011 21:07	

Table 11.1.1 – Timing of information provided by Seqwater to BoM and Brisbane City Council around floodwater releases

- Issued Situation Reports to BoM, Councils and internal Seqwater recipients up to four times per day during the formative stages of the Event. The frequency of issue reduced following the peak of the Event at Wivenhoe Dam. Details of these reports are contained in Appendix E.
- Compiled Technical Situation Reports (TSR) around the floodwater release from Wivenhoe Dam and provided these to the Water Grid Manager. TSRs were provided more frequently during critical periods of the Flood Event. Appendix F contains a copy of all TSRs issued during the Event.

2. Briefing and activation

If public safety is considered to be at risk during a flood event, disaster management arrangements may be activated. Seqwater understands the following actions were undertaken in accordance with the Protocol during the January 2011 Flood Event:

- The Brisbane City Council, Ipswich City Council and Somerset Regional Council activated their Local Disaster Management Groups;
- Local Disaster Management Groups informed the relevant District Disaster Coordinators of the situation;
- The Queensland Police Service initiated disaster management actions as provided for under the Disaster Management Act 2003;
- The Water Grid Manager alerted the Director-General of the Department of Community Safety and DERM, as well as the Brisbane City, Ipswich City and Somerset Regional Councils;

11 EVENT COMMUNICATION (continued)

- The Director-General of the Department of Community Safety informed the Director-General of the Department of Premier and Cabinet, the Chair of the State Disaster Management Group and activated the State Disaster Coordination Centre. The Director-General of the Department of Community Safety also informed the Minister for Police, Corrective Services and Emergency Services;
- The Director-General of DERM informed the Minister for Natural Resources, Mines and Energy;
- The Director-General of the Department of Premier and Cabinet informed the Premier;
- The Crisis Communications Network, chaired by the Department of Premier and Cabinet, was activated at the direction of the State Disaster Management Group Chair to coordinate public messaging from BoM, Seqwater, the Water Grid Manager, Queensland Police Service, relevant Councils and the Department of Community Safety.

Deleted: (DPC)... (SDMG)... (SDCC)... [1]

3. Public communications issues

The Protocol allows each agency to initiate public communication and engage disaster management processes as they deem appropriate. The trigger points for initiating public communication during a flood event are defined according to an agency's responsibilities. During the January 2011 Flood Event, as it became apparent public impacts were likely, local, State and Commonwealth agencies increased the frequency of their communication with the community.

Deleted: the ...of information ...ir... communication with ... as it became apparent public impacts were likely [2]

The Protocol states that each agency is responsible for publicly communicating information commensurate with their role, which can be done without prior approval. However, during the January 2011 Flood Event, agencies shared information prior to its public release to ensure the information provided was always consistent.

Deleted: . This ...s... public information was provided [3]

Under the requirements of the Manual, Seqwater is responsible for issuing information to the public and media regarding storage conditions and Dam releases. However, in relation to the Water Grid, the Water Grid Manager is the State's designated lead communication agency on floodwater releases. During the Flood Event, Seqwater provided relevant and timely information to the Water Grid Manager who then communicated this detail to the public and media.

Deleted: the ...e... of...d... to the public and the media [4]

Seqwater understands the following agencies were responsible for communicating specific information during the Event, in accordance with the Protocol:

- BoM – Communicated flood warnings broadly using the BoM website (www.bom.gov.au), through other agencies and the media. Representatives from BoM also participated in media (radio, television, newspaper) interviews to provide factual information regarding observed and forecast weather conditions, rainfalls and water levels.
- Local governments / Local Disaster Management Groups – Communicated the effects of weather-related events and the potential safety impacts for local communities, residents, and Council-owned assets. Local governments were primarily responsible for communicating within their community.
- Water Grid Manager – Publicly communicated aspects of floodwater release timing and the expected duration of the impacts. Seqwater operational staff ensured supporting technical information was provided to the Water Grid Manager and the Water Grid Manager took responsibility for liaising with local governments and coordinating any public communication in relation to the flood releases.

Deleted: Under the arrangements in place during the Flood Event for disseminating information to the public and the media in relation to the Water Grid, Seqwater met this responsibility by providing relevant information to the Water Grid Manager, the State's designated lead communication agency on floodwater releases. The Water Grid Manager then communicated the provided information to the public and the media. [5]

Deleted: Bureau of Meteorology

Deleted: Concentrated on ..., which were communicated broadly ... via ... other [6]

Formatted: Font: Not Bold

To support the above processes, Seqwater provided regular situation updates to the Water Grid Manager, Brisbane City Council, Ipswich City Council and Somerset Regional Council. In addition, Seqwater also provided regular updates to mid-Brisbane irrigators during the Event. All updates were also provided to the Water Grid Manager.

Deleted: L...G [10]

11 EVENT COMMUNICATION (continued)

- **Department of Community Safety** – Communicated general safety matters regarding flooding.

Information was released to the public as required throughout the Event. The timing of media releases was guided by the frequency with which technical reports became available and the content of these reports. Report frequency ranged from once a day to an appropriate higher frequency during the critical stages of the Event.

Seqwater understands the Water Grid Manager's Communications Unit centrally tracked and shared all communications and liaised with the following agencies in regard to public safety messages:

- BoM;
- Seqwater;
- Councils' Media Directors;
- The Queensland Police Service Media Director;
- The Department of Community Safety Media Director.

Overall, the public and agency communication undertaken by Seqwater throughout the Event was in accordance with the procedures outlined in the Protocol.

12 REVIEW OF DATA COLLECTION SYSTEMS

12.1 Review of data collection system performance during the Event

Due to the rarity of flood events the size of the January 2011 Flood Event, the rainfall and stream height field stations used to collect data, had never been tested by a flood of this size. Because of this, some field failures did occur during the January 2011 Flood Event, however, such failures would be expected in all systems of this type world-wide when impacted by an event of this magnitude. Some stations were completely destroyed by the volume and magnitude of the flood flows and, by surveying the aftermath of the flood and its impacts along the river channels, it is easy to see how this occurred.

After the Event, 14 out of 75 rain stations, and 31 out of 71 river height stations, were not operating correctly. This is considered a good result, with the station redundancy system Seqwater has in place within the network mitigating the impacts of these failures. Data omissions or errors resulting from these failures did not adversely impact operational decision-making.

However, one gap did occur in the recording of rainfall data on Tuesday 11 January 2011, during the period of intense rainfall that resulted in the extreme and rapid rises in the level of Wivenhoe Dam. The rainfall experienced during this time was not recorded as it fell directly on the Wivenhoe Dam lake, in an area where there are no catchment rain gauges. A similar scenario also occurred the previous day when extreme rainfall lead to flash flooding in the Lockyer Valley. This extreme rainfall was also not recorded in the catchment rain gauges.

In order to counteract this issue for future events, a solution may be to expand the network and install additional rain gauges in the Brisbane Basin. This issue will be examined in detail in conjunction with BoM and other relevant agencies as soon as practical. However, it should be noted that, within an area the size of the Brisbane Basin, it is not practically possible to guarantee any extensive rain gauge network will detect all instances of rainfall that occurs in this area.

12.2 Future of the data collection system

The current ALERT data collection network has been operational since 1995. Overall, the performance of the system has been satisfactory, with the following improvements made in recent times:

- Seqwater employed a dedicated hydrographic team to enhance and maintain the data collection network. This team continues to be supported by the RoadTek technicians who have been maintaining the network since its initial installation.
- In 2008/09, around 30 stations were upgraded with new generation ALERT Event Reporting Radio Telemetry System (ERRTS) equipment. Following the upgrading of a further 55 sites in 2009/10, almost all the ERRTS equipment in the Seqwater ALERT network has now been upgraded.
- In 2008/09 and 2009/10, new rainfall stations were constructed and installed at the following locations:
 - Lindfield;
 - Westvale;
 - Hazeldean;
 - Monsildale;
 - Mt Stanley;
 - Mt Binga;
 - Blackbutt;
 - Redbank Creek.
- In 2008/09 and 2009/10, new or upgraded rain/river height stations were constructed and installed at the following locations:
 - Atkinson Dam;
 - Bill Gunn Dam;
 - Lake Clarendon Dam;
 - Moogerah Dam;
 - North Pine River at Dayboro Waste Water Treatment Plant.

12 REVIEW OF DATA COLLECTION SYSTEMS (continued)

- In 2008/09 and 2009/10, new river height stations were installed at the following locations:
 - Kilcoy Creek downstream of Kilcoy Weir;
 - Kobbie Creek at Mt Samson.

The network will undergo further upgrades and enhancements over the coming years as Seqwater looks to maximise the System's overall reliability. In conjunction with BoM, Seqwater is continually seeking ways to improve the network, particularly in line with the advancement of available technology.

13 REVIEW OF FLOOD OPERATIONS CENTRE MOBILISATION AND STAFFING

13.1 Flood Operations Engineers

Deleted: Duty

The four Flood Operations Engineers approved by the Chief Executive Officer to direct the operations of Somerset and Wivenhoe Dams during flood events are:

Deleted: Duty

1. Engineer 1;
2. Engineer 2;
3. Engineer 3;
4. Engineer 4.

As previously stated, the four current Flood Operations Engineers undertake flood operations duties in addition to their senior full-time roles within various State Government organisations. These flood operations duties include 24/7 on call duties, 24/7 catchment monitoring during rainfall events and undertaking 12 hour shifts during flood events. **Flood Operations Engineers do not receive any additional payments to undertake these flood operations duties.** This includes requirements to work extended hours on Christmas Day, Boxing Day, New Years Day and other public holidays, as has occurred in recent months. Flood Operations Engineers are also generally responsible for their own travel and meal arrangements when working in the Flood Operations Centre and in some current instances Flood Operations Engineers undertake the role on a purely voluntary basis. This arrangement is in contrast to BoM who employ a dedicated team of full time permanent staff to undertake flood forecasting.

Formatted: Font: 9 pt

Formatted: Font: 9 pt

Formatted: Font: 9 pt

During the Event, the Duty Engineers worked long hours and functioned on a limited amount of sleep, particularly during the critical period of the Event between Sunday 9 January 2011 and Wednesday 12 January 2011. These demands are expected with this work and decision making was not adversely impacted by these requirements.

Deleted: While t

Deleted: ,

Deleted: in any way

As previously stated, it should also be noted that the Flood Operations Engineers managed flood operations activities at North Pine Dam in conjunction with managing the January 2011 Flood Event impacting on Somerset Dam and Wivenhoe Dam. Preliminary indications based on the North Pine Dam Emergency Action Plan, are that the flood event impacting North Pine Dam was in the extreme range (AEP greater than 1 in 2000).

Deleted: during the Event. However, it is recommended the following support mechanisms are examined to determine any valuable improvements to the current system

Number of Flood Operations Engineers

Deleted: Duty Engineers

The appropriate number of Flood Operations Engineers required to work during an event has been widely considered and discussed over the past 15 years. From the perspective of event management continuity and coordination, a small team of very expert and experienced staff working closely together is preferred. However, this must be considered in line with the potential impact of fatigue during larger events or extended periods of operation and subsequent report writing.

Deleted: Duty

From 1996 to date, engaging four Flood Operations Engineers has proven to be sufficient when managing flood events impacting the Dams. There are currently also three professionally qualified engineers working within the flood officer team who gain valuable event experience that will eventually enable them to transition to the Duty Engineer role should this be deemed appropriate. Factors that could assist in managing fatigue will be examined further in conjunction with the Dam Safety Regulator at an appropriate time following the submission of this Report.

Formatted: Bullets and Numbering

Deleted: Duty

Deleted: effective

Deleted: ¶

Work hours

While the work hours during the Event were long, they were not considered excessive or to be at a level that adversely impacted on operational decision making. Natural disaster emergency management requires efforts above and beyond normal day-to-day operations, and the Flood Operations Engineers fully accept and understand this is a responsibility of their role.

Deleted: Duty

Deleted: position

Deleted: ¶

13 REVIEW OF FLOOD OPERATIONS CENTRE MOBILISATION AND STAFFING (continued)

13.2 Flood Officers

The nine Flood Officers that assisted in the Flood Operations Centre during the Event were:

1. Flood Officer 1;
2. Flood Officer 2;
3. Flood Officer 3;
4. Flood Officer 4;
5. Flood Officer 5;
6. Flood Officer 6;
7. Flood Officer 7;
8. Flood Officer 8;
9. Flood Officer 9.

Similar to the role of the Flood Operations Engineers, Flood Officers fill their roles on an "as needed" basis only, as they fill full time roles within their various organisations and only undertake flood operations duties when "on call" (average on one week in four) or during flood events. All Officers have been trained in Flood Operations Centre duties and completed their allocated tasks efficiently, correctly and with a high degree of professionalism over the full duration of the Event. A team of around 9 to 10 persons has proven appropriate for this role.

Flood Officers generally work on paid overtime arrangements in accordance with their respective industrial awards when undertaking flood operations duties.

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHECKED OR VERIFIED INFORMATION

14 REVIEW OF DAM SITE MOBILISATION AND STAFFING

Deleted: thirteen

The ~~13~~ Dam Operators that operated Somerset and Wivenhoe Dams during the Event were:

1. Dam Operator 1;
2. Dam Operator 2;
3. Dam Operator 3;
4. Dam Operator 4;
5. Dam Operator 5;
6. Dam Operator 6;
7. Dam Operator 7;
8. Dam Operator 8;
9. Dam Operator 9;
10. Dam Operator 10;
11. Dam Operator 11;
12. Dam Operator 12;
13. Dam Operator 13.

All Operators have been trained in Flood Operations Centre duties and all completed their allocated tasks efficiently, correctly and with a high degree of professionalism over the duration of the Event. Dam Operators are either full time Segwater Dam site staff or full time Segwater field personnel working on and around the Dam sites. All Dam Operators have been trained in their required duties and completed their allocated tasks efficiently, correctly and with a high degree of professionalism over the full duration of the Event. A team of around 13 to 15 persons has proven appropriate for this role. Dam Operators work on paid overtime arrangements in accordance with their respective industrial awards when undertaking flood operations duties.

The following is a list of suggestions that will help to ensure the Dam Operators are fully supported and can continue to perform their roles with a high level of effectiveness in future events:

- Housing arrangements that provide for trained operators living on site should continue as this was shown to be critically important during extreme events of this nature to ensure a timely response to developing situations;
- Local staff members working on site during flood events need to be able to maintain contact with their family and friends to provide reassurance they are safe and secure while on duty. This is an issue that may have caused some anxiety at certain stages of the January 2011 Event and will be addressed;
- There were no equipment breakdowns during this Flood Event, and multi-level operational back-up systems are provided to release flood water if breakdowns do occur. However further investigations will be undertaken to determine if it is appropriate to provide additional trade support to site above the current level provided during flood events. This is to ensure that the risks associated with all possible equipment failure scenarios during extreme events are fully managed.

Unless trade support can be sourced prior to the closure of Brisbane Valley Highway, the Dams may not be accessible in extreme events as travel to the Dams becomes difficult and at times, impossible. The ability to ensure early in the event that trade support is accessible should be examined.

15 REVIEW OF FLOOD MODELLING SYSTEMS

15.1 Review of system performance during the Event

The Real Time Flood Model (RTFM) and associated systems performed well during the Event as described in detail in Section 8. No system failures occurred during the Event and, generally, the systems closely modelled actual stream flow.

One difficulty was encountered during the period of intense rainfall that occurred on Tuesday 11 January 2011, when there were extreme and rapid rises in the level of Wivenhoe Dam. The very intense rainfall generally fell directly on the Wivenhoe Dam lake and was not recorded in rain gauges, which resulted in the RTFM not accurately modelling the rapid rises in the Dam level. This scenario was similar to the flash flooding experienced in Lockyer Valley the previous day. As previously discussed, this is a data collection issue rather than a modeling issue and a review of the existing data collection network will be undertaken as discussed in Section 12.

In summary, there were no operational flaws or errors detected in the existing RTFM system that adversely impacted Event decision making.

15.2 Future of the RTFM

The RTFM was originally developed more than 15 years ago and primarily resides on the Linux Fedora Core Operating System. Although there were no system failures experienced during previous flood events or the current Flood Event, the age of the software is such that Seqwater commenced developing a replacement RTFM in 2008 in conjunction with the Dam Safety Regulator and other key stakeholders including BoM. This new system is expected to be implemented and operational in 2011 following approval from the Dam Safety Regulator. The updated system uses the same hydrologic models but operates under a more robust platform that provides an enhanced user interface. This work has been undertaken in accordance with Seqwater's policy of continual improvement of the system in line with advances in technology.

Independent of the RTFM, Seqwater has developed a series of URBS flood models for all of its storages, including Somerset Dam and Wivenhoe Dam. These models are linked to the BoM Enviromon data collection system and can be run in real time. This system provides a backup to the RTFM software in the Flood Operations Centre and was used as a verification tool during the Event. Generally, this system provided very similar modelling results to the RTFM and experienced similar difficulties to the RTFM in accurately modelling the rapid rises in the Wivenhoe Dam lake level that occurred on Tuesday 11 January 2011 as described in Section 15.1.

DRAFT ONLY - THIS DOCUMENT CONTAINS UNCLASSIFIED INFORMATION

A secondary component of the original RTFM software (WIVOPS) that assisted in formulating the gate operating strategy at Wivenhoe Dam is no longer used. This software was retired in 2005 following the construction of the Dam's auxiliary spillway, comprising three fuse plugs. A number of factors were considered in this retirement process, including the age of the WIVOPS program (more than 15 years), the absence of program documentation and the complexity of the required programming changes to account for the new auxiliary spillway.

Detailed operational spreadsheets are currently used in place of WIVOPS and these worked very well during this Event (see Section 8.0 and Appendix A). WIVOPS was used as a verification tool during the Event (see Section 8.0), within the limits of its operational effectiveness. A dedicated program with similar functionality to WIVOPS has also been under development since 2010 and, when complete, will be evaluated to determine its operational role and function during an event.

16 REVIEW OF THE MANUAL'S OBJECTIVES AND STRATEGIES

Deleted: FLOOD
Deleted: PROCEDURES

16.1 The Manual

Deleted: Intent of t

The Manual of Operational Procedures for Flood Mitigation at Wivenhoe Dam and Somerset Dam (Revision 7) (the Manual) defines the objectives and procedures for operating the Dams during flood events.

Formatted: Font: Italic

The Manual is an approved Flood Mitigation Manual under Chapter 4, Part 2 of the Water Supply (Safety and Reliability) Act 2008 (the Act). The Manual is approved by the Chief Executive of the Department of Environment and Resource Management in accordance with the Act. An owner of a dam who observes the operational procedures in an approved flood mitigation manual, does not incur civil liability for an act done, or omission made, honestly and without negligence in observing the manual procedures.

Deleted: Flood events that impact Somerset Dam and Wivenhoe Dam are caused by rainfall events that vary in intensity, duration and distribution over a catchment area exceeding 7,000km² above the Dams. When making decisions about releasing water from the Dams during flood events, consideration is also given to rain falling in Brisbane River catchment areas not controlled by the Dams. These catchment areas, which include the Lockyer Creek and Bremer River catchments, also cover an area in the order of 7,000km² and rain falling in these catchments will also vary in intensity, duration and distribution. Accordingly, the Manual must account for an infinite number of flood event scenarios. ¶
The current level of forecasting technology does not make it possible for the Bureau of Meteorology (BoM) to provide completely accurate rainfall forecasts for the Dam catchment areas. A degree of uncertainty exists in all weather forecasts and the further forward in time forecasts are provided, the greater the degree of uncertainty. ¶ (... [1])

16.2 Manual objectives

The primary objectives of the procedures contained in the Manual, in order of importance, are:

1. Ensure the structural safety of the Dams;
2. Provide urbanised areas with optimum protection from inundation;
3. Minimise the disruption to rural life in the valleys of the Brisbane River and Stanley River;
4. Retain the storage at Full Supply Level (FSL) at the conclusion of the flood event;
5. Minimise impacts to riparian flora and fauna during the drain down phase of the flood event.

To meet these objectives, the Dams must be operated in a manner that considers the potential effects of closely spaced flood events. Accordingly, normal procedures require stored floodwaters to be emptied from the Dams within seven days of the flood event peak passing through the Dams.

Throughout the duration of this Event, the Manual objectives were always considered in order of importance, and the requirement to empty the stored floodwaters within seven days of the flood event peak passing through the Dams was also achieved.

Following the Event, some discussions occurred in the public arena in relation to lowering the emphasis on minimising disruption to rural life in the valleys of the Brisbane and Stanley Rivers for anything but very minor events. The Dams could be operated in this way if desired. However, changing the emphasis of the objectives would also require a change to the current version of the Manual.

16.3 Manual strategies

As discussed in detail in Section 10, a range of strategies were used during the Event, in accordance with the Manual. Having to apply the strategies during such an extremely large and rare event provided the opportunity to consider how the strategies are worded from a practical sense.

The strategies provided a good guide in responding to the full range of scenarios presented by this Event, however some situations may benefit from additional points of clarification, and this will be reviewed in conjunction with the Dam Safety Regulator following the submission of this report. It should be noted however, that due to the high degree of scenario variability, improving the Manual in this regard may not be possible. Certainly, any changes to the Manual in the areas discussed below would require extensive and detailed engineering and hydrological investigations prior to any proposed changes being formally adopted.

- Under Strategy W3, it would be useful for additional guidance to be provided as to the extent to which the flow at Moggill should be minimised prior to the natural peak occurring at that location.
- Under Strategy W3, it would be useful for additional guidance to be provided on the consideration to be given to lower level Manual objectives.

16 REVIEW OF THE MANUAL'S OBJECTIVES AND STRATEGIES (continued)

Deleted: FLOOD
Deleted: PROCEDURES
Deleted: REVIEW OF FLOOD MANUAL PROCEDURES AND STRATEGIES

- Under Strategy W3, it would be useful to provide guidance on the acceptability of increasing the flood at Moggill above its naturally occurring peak (excluding Wivenhoe releases) but within the upper limit of non-damaging floods downstream.
- Under Strategy W3, it would be useful to clarify the flow at Moggill that defines the upper limit of non-damaging floods downstream. During the Event, Brisbane City Council provided information and damage curves to the Flood Operations Centre indicating the upper limit flow at Moggill was as low as 2,000m³/s, whereas the Manual specifies the flow as 4,000m³/s. This number must be agreed as it defines the intent of Strategy W3.
- Under Strategy W4, it would be useful to provide additional guidance on gate opening and closing rates.

Formatted: Indent: Left: 0 cm, Hanging: 0.5 cm, Bulleted + Level: 1 + Aligned at: 0 cm + Tab after: 0.63 cm + Indent at: 0.63 cm, Tabs: Not at 0.63 cm

Deleted: During the Event, this requirement competed with the need to protect urban areas by not allowing Wivenhoe Dam to reach a level that invoked Strategy W4. After considering these issues during the Event, it was decided the best course of action would be to increase releases to the limit of non-damaging flows at Moggill, prior to the natural peak occurring at Moggill. This ensured the structural safety of the Dams and provided urbanised areas with optimum protection from inundation.

Deleted:

Deleted: 3

Deleted: sequences

Deleted: would be useful

Deleted: During the Event, a decision was made to begin closing the gates as quickly as possible, to reduce urban flood impacts once the Wivenhoe Dam level peaked. This was decided in an attempt to minimise urban damage below Moggill (an objective which must be considered under Strategy W4). Gates would have been re-opened if further lake level rises were experienced, however this scenario is not specifically addressed in the Manual. Under Strategy S2, additional guidance on actions to take when the Wivenhoe Dam Level is falling and the Somerset Dam Level is below 100.45 would be useful.

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHECKED OR VERIFIED INFORMATION

Flood events that impact Somerset Dam and Wivenhoe Dam are caused by rainfall events that vary in intensity, duration and distribution over a catchment area exceeding 7,000km² above the Dams. When making decisions about releasing water from the Dams during flood events, consideration is also given to rain falling in Brisbane River catchment areas not controlled by the Dams. These catchment areas, which include the Lockyer Creek and Bremer River catchments, also cover an area in the order of 7,000km² and rain falling in these catchments will also vary in intensity, duration and distribution. Accordingly, the Manual must account for an infinite number of flood event scenarios.

The current level of forecasting technology does not make it possible for the Bureau of Meteorology (BoM) to provide completely accurate rainfall forecasts for the Dam catchment areas. A degree of uncertainty exists in all weather forecasts and the further forward in time forecasts are provided, the greater the degree of uncertainty.

As it is not possible to provide a specific procedure for Dam operation during every possible flood event, the Manual takes the approach of providing objectives and strategies to guide operational decision-making during a flood event. The objective followed and strategy chosen at any point in time depends on the actual water levels in the Dams as well as flood modelling predictions based on the best observed and forecast rainfall and stream flow information available at the time.

It is not possible to predict the range of objectives and strategies that will be used during the course of a flood event, before or at any time during the event, prior to the event peak. Objectives and strategies change as flood events progress, as rainfall is received in the catchment and as forecast rainfall amounts change. For small floods, objectives and strategies relate to minimising flood impacts in rural areas, while as the scale of the flood increases, the emphasis changes to protecting urban areas and maintaining the structural safety of the Dam

Additionally, while ensuring the Dams are operated during flood events within the Manual objectives, Seqwater's duty of care to the public is also a primary consideration when making flood releases from the Dams. Every attempt is made to ensure public roads are closed prior to inundation by Dam outflows and that authorities are provided with enough time to prepare for community isolations and to undertake evacuations. Every attempt is also made to ensure urban damage is minimised, and that Dam outflows with the potential to contribute to urban damage are delayed until it is apparent no other options are available without risking the safety of the Dams.

Due to the associated impacts to the public, changing this emphasis remains a political decision, however it is noted

17 REVIEW OF WIVENHOE DAM FULL SUPPLY LEVEL

Following the January 2011 Flood Event, there has been significant public discussion around the appropriate Full Supply Level (FSL) of the Dams and whether the FSL should be lowered.

The FSL of Somerset Dam and Wivenhoe Dam are contained in the Moreton Resource Operations Plan (see pages 91 and 93), which was developed by the Department of Environment and Resource Management (DERM) in accordance with the *Water Act 2000*. DERM is responsible for developing and approving all resource operations plans in Queensland, and the current Moreton Resource Operations Plan was approved by Governor-in-Council in December 2009. It is publicly available on the DERM website (www.derm.qld.gov.au). Seqwater's Resource Operations Licence requires compliance with the relevant parts of the Moreton Resource Operations Plan, including the prescribed FSL.

Deleted: sel

The Manual states:

1. that an explicit objective is to "retain the storage at full supply level at the conclusion of the Flood Event". In Section 3.5 of the Manual, it states "as the dams are the primary urban water supply for South East Queensland, it is important that all opportunities to fill the dams are taken. There should be no reason why the dams should not be full following a Flood Event";
2. in Section 8.3, "the spillway gates are not to be opened for flood control purposes prior to the reservoir level exceeding EL 67.25", which is 0.25 metres above FSL.

Formatted: Font: Not Italic

Deleted: y"

In view of the above, it can be seen that Flood Operations Engineers do not set the FSL of the Dams and they are not authorised to make decisions in relation to setting or changing the FSL of the Dams at any time, either during or following Flood Events.

Deleted: id

If a decision is to be made by DERM to permanently lower the FSL, detailed consideration will need to be given to the procedures in the Manual as the procedures assume the existing FSL.

DRAFT ONLY - THIS DOCUMENT CONTAINS UNCHECKED AND UNVERIFIED INFORMATION

18 REVIEW OF AGENCY COMMUNICATION

As discussed in Section 11, Queensland's disaster management response is provided by various disaster management groups at local, district and State levels. This collaborative approach to disaster response ensures an effective and timely coordination of information and services state-wide, whenever disaster strikes.

Deleted: 0

Under the requirements of the Manual, Seqwater is responsible for issuing information to the public and media regarding storage conditions and Dam releases. During the January 2011 Flood Event, Seqwater followed the draft Communication Protocol that was developed by DERM for this purpose. From Seqwater's perspective, the Protocol worked and communications were managed effectively. However, to properly assess communications, detailed feedback on the effectiveness of Seqwater communications during the Flood Event must be obtained from the following agencies:

Deleted: a

Deleted: (that was developed following the October 2010 Flood Event) was used to manage communications between Seqwater and the relevant local, State and Commonwealth agencies impacted by the release of floodwater from the Dams.

Deleted: well

- Brisbane City Council;
- Ipswich City Council;
- Somerset Regional Council;
- Water Grid Manager;
- Queensland Police Service;
- Department of Community Safety;
- Department of Environment and Resource Management;
- Department of Premier and Cabinet;
- Bureau of Meteorology.

To date, this process has not commenced however, this work will proceed as soon as appropriate personnel are available to undertake the necessary review. In the interim, Seqwater has provided comment below and suggested preliminary recommendations to improve communications during flood events, based on the experiences of the January 2011 Event. The comments and preliminary recommendations are made in accordance with the three stages in the communication process contained in the Protocol, which are:

Deleted: ¶

Deleted: ¶

1. Monitoring and assessment;
2. Briefing and activation;
3. Public communications.

The comments and preliminary recommendations are summarised below.

1. Monitoring and assessment

- Seqwater discussions with BoM relating to modelling result comparisons, and actual and projected Dam outflows were beneficial to both parties.
- Seqwater also provided modelling results to Brisbane City Council. It remains unclear how Council used this information or if it proved beneficial. Generally, it appears the most relevant information required by the Council was projected flood height data, and this is estimated and issued by BoM. It is recommended the provision of technical data from Seqwater to Brisbane City Council be examined further with Council, with a view to ensuring only useful data is provided to avoid any potential confusion associated with the provision of superfluous data.
- It is also recommended that investigations be undertaken to explore the benefits of a more formal arrangement with BoM in relation to the provision of rainfall forecast information during flood events. While sufficient rainfall forecasting information was available to the Flood Operations Centre during the Flood Event, and regular informal discussions were held with BoM in relation to the forecasts, there may be an opportunity to improve this process by including some appropriate procedures in the Communication Protocol.

Deleted: ,

Deleted: worked well and

Deleted: s

Deleted: -----

2. Briefing and activation

18 REVIEW OF AGENCY COMMUNICATION (continued)

Situation Reports and Technical Situation Reports were provided to relevant government agencies at regular intervals over the duration of the Event. There has not been any specific feedback received to date indicating whether this process worked well. However, as previously discussed, Seqwater will seek detailed feedback on the effectiveness of its communications with the agencies involved, with a view to implementing any suggested improvements arising from these discussions.

3. Public communications issues

There were no specific public communications made by Seqwater during the January 2011 Flood Event, as the Water Grid Manager was assigned the responsibility of being the State's lead communication agency on floodwater release information. Seqwater operational staff ensured technical information was communicated to the Water Grid Manager, as requested, to support all public communication.

It is understood the Water Grid Manager is currently reviewing the effectiveness of these processes

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHECKED OR VERIFIED INFORMATION

19 REPORT CONCLUSIONS

Following are the significant conclusions drawn from the information contained in this Report.

The significant conclusions drawn from the information contained in this Report include:

- During the January 2011 Flood Event, Somerset Dam and Wivenhoe Dam were operated in accordance with *The Manual of Operational Procedures for Flood Mitigation at Wivenhoe Dam and Somerset Dam (Revision 7)*.
- The data collection and flood modelling systems used to support decisions made during the Event performed well and assisted informed decision-making, in accordance with the Manual.
- The uncertainty of BoM rainfall forecasts did not support the additional release of flood water early in the Event.
- During the Event, Seqwater followed the Department of Environment and Resource Management's draft Communications Protocol which was compiled after the October 2010 flood event. This Protocol was developed to ensure effective communication between local, State and Commonwealth agencies impacted by the release of floodwater from the Dams.
- The January 2011 Flood Event was an extremely large and rare flood event. The combined effects of Somerset Dam and Wivenhoe Dam did reduce flood damages downstream however, they could not fully mitigate the impacts of the Event without putting the safety of the Dams at risk.
- Studies associated with the design and operation of Wivenhoe Dam dating back to 1971, indicate a flood of the magnitude of the January 2011 Flood Event would be expected to result in urban damage below Moggill.
- The combined effects of Somerset Dam and Wivenhoe Dam provided clear and greatly significant flood mitigation benefits during the January 2011 Flood Event.

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHECKED OR VERIFIED INFORMATION

20 REPORT RECOMMENDATIONS

Following is a summary of the key recommendations contained in this Report.

Deleted: r

- In conjunction with the Bureau of Meteorology (BoM) and other relevant agencies, examine whether additional rain gauges should be installed in the Brisbane River Basin to improve the level of data recorded during flood events. It is recognised that installing additional gauges may not guarantee the rain gauge network will detect all instances of very intense or extreme rainfall that could occur in the Basin area.
- Given that a rare and very large flood event occurred, it is recommended a formal review of *The Manual of Operational Procedures for Flood Mitigation at Wivenhoe Dam and Somerset Dam (Revision 7)* (the Manual) be undertaken. This is a requirement of the Manual when an event of this nature is experienced. The issues raised in Section 16 should be considered in this process.
- In conjunction with BoM and other relevant agencies, it is recommended Seqwater participate in a review of the Agency Communications Protocol used during the Flood Event. This Event was the first major test of the Protocol since its development in October 2010 and therefore a full review at this time would be appropriate.

APPENDIX A – MODEL RESULTS

The following table and associated graphs represent a summary of the model results used to support operational decision making during the Event. Only model runs at the critical times corresponding to the Flood Event Summary contained in Section 2 of this Report, are included in the summary however, model runs between these times are also available. Model run numbers have been edited to provide a sequential list. An indication of the number of additional runs that are available between individually presented runs can be determined by examining these model run numbers.

During the Event some model runs were over-written as new model runs are generally created by using the most recent model run as a base. If the run being used as a base is not explicitly saved, it will be lost. This does not present a problem from an operational sense because historical model runs, which do not consider the effects of rainfall between the time of a decision and the time the historical run was created, have little bearing on operational decision making.

For the purpose of this Report, any over-written model runs have been re-created. This is possible at any time from when the model run was initially created to the future because all model runs are based on actual rainfall recorded in the relevant rain gauges at the time the model run was created. This information is contained in a data archive and, if required, can also be obtained separately and independently from BoM for verification purposes. In the case of model runs containing forecast rainfall, the forecast rainfall used was based on the BoM catchment average Quantitative Precipitation Forecasts (QPFs) contained in Appendix C.

When examining the model results, it should be noted the forecast rainfall model results apply the full 24-hour catchment average rainfall forecast from the BoM QPF's to the model run. This is regardless of the model run time in relation to the issue time of the forecast and regardless of the rainfall since the forecast was issued. In effect, this provides a "worst case" 24-hour scenario.

Finally, the values and graphs contained in this Appendix are obtained from the flood modelling spreadsheets. Similar to the modelling runs, the creation of saved spreadsheets in this Appendix corresponds to the critical times contained in the Flood Event Summary. During the Event, the spreadsheets were updated continuously with both updated model results and hourly manual water level readings from the Dams, with a single "live" spreadsheet always being available to be used as the basis of flood operations decision making. During the Event, spreadsheets were not necessarily explicitly saved at times corresponding to the Flood Event Summary, and in a similar manner to the re-creation of model runs where this has not occurred, spreadsheets have been re-created from archived data.

APPENDIX D – CATCHMENT RAINFALL

Average rainfall for each subcatchment in the Brisbane Basin is determined by applying a weighting to the rainfall depth at each available station within the subcatchment.

Within the operational system, the Brisbane Basin is divided into the subcatchments shown in the Figure below.

The Somerset catchment represents the average catchment rainfall in the Stanley River to Somerset Dam.

The upper Brisbane River to Wivenhoe Dam, excluding the Somerset Dam catchment, is a weighted average of the upper and middle Brisbane catchments.

Two tables of catchment rainfall are provided; the first is of daily catchment rainfall in the 24 hours on the date shown, while the second corresponds to critical periods listed in the operational strategy.

Period ending 09:00	Stanley		Upper Brisbane		Lockyer		Bremer		Lower

APPENDIX E – SITUATION REPORTS

Situation Report 1

Date: Thursday 6 January 2011

Time: 08:14

From: Duty Engineer
Sent: Thursday, 6 January 2011 8:14 AM
To: Distribution List
Subject: Situation Report 0800 06/01/2011

Rainfall

Since 9am Wednesday, there have been widespread falls of 30mm with isolated heavy falls up to 50mm in the Somerset and Wivenhoe catchments. Totals in the North Pine catchment have generally been below 10mm. Falls up to 60mm were recorded in the Leslie Harrison catchment.

The forecast for the next 24 to 48 hours is for totals up to 150mm in SE Qld.

The catchments remain wet and are likely to generate additional runoff in the event of rain.

North Pine Dam

At 0700 Thursday, North Pine Dam was 39.60m, 0.05m below gate trigger level and having risen 0.18m since 2/1/2011 due to a combination of baseflow and runoff from rain in the last 24 hours.

Given the forecast rain, gate operations will commence tonight. MBRC will be advised this morning

Somerset Dam

At 0700 Thursday, Somerset Dam was 99.34m, 0.34m above FSL, and rising slowly. The rain in the Stanley River catchment has produced a small amount of runoff in the upper Stanley but there have been significant rises in Kilcoy Ck. Further regulator operations will be required later Thursday.

Wivenhoe Dam

At 0700 Thursday, Wivenhoe Dam was 67.31m and rising slowly. This is 0.31m above FSL and above the gate trigger level of 67.25m. There have been rises recorded at rivers and stream upstream of Wivenhoe Dam. Gates will be opened in the next 24 hours to manage the inflows from the upper Brisbane River and the outflow from Somerset.

Impacts of Wivenhoe Dam Releases

Somerset Regional, Ipswich City and Brisbane City Councils will be advised of the potential for gate operations after a full assessment of the situation this morning. At this stage it is anticipated that peak releases from Wivenhoe will be below 500m³/s but this will depend on the forecast rain and flows downstream of the dam.

The expected Wivenhoe release and local flows will at least impact upon Twin Bridges, Savages Crossing, Kholo Bridge and Colleges Crossing for several days. At this stage,

APPENDIX E – SITUATION REPORTS (continued)

there are not expected to be any adverse impacts upon Fernvale Bridge, Burtons Bridge or Mt Crosby Weir Bridge

Leslie Harrison Dam

Following the heavy rainfall Wednesday night, gate operations commenced at Leslie Harrison Dam late Wednesday night and are continuing. Given the forecast rainfall, gate operations are expected to continue for the next 24 to 48 hours.

The next situation report will be issued at 1800 Thursday 6/1/2011.

Rainfall

In the 6 hours since 9am Wednesday, there have been general totals around 30mm with isolated heavy falls up to 60mm in the Somerset and Wivenhoe catchments. Totals in the North Pine catchment have generally been between 20 and 30mm. Falls between 20 and 30mm were recorded in the Leslie Harrison catchment.

The forecast for the next 24 to 48 hours is for totals up to 100mm in SE Qld.

The catchments remain wet and are likely to generate additional runoff in the event of rain.

North Pine Dam

At 1400 Thursday, North Pine Dam was 39.66m, 0.01m above gate trigger level. Gate operations will commence at 1900 Thursday and will impact upon Youngs Crossing. MBRC have been advised and will confirm closure of Youngs Crossing prior to gate operations. Given the forecast rainfall during Friday, gate operations may continue into Saturday.

Somerset Dam

At 0700 Thursday, Somerset Dam was 99.34m, 0.34m above FSL, and rising slowly. The rain in the Stanley River catchment has produced a small amount of runoff in the upper Stanley but there have been significant rises in Kilcoy Ck, adding to the Somerset inflows. Further regulator/sluice operations will be required in the next 24 to 48 hours. The estimated event inflow volume into Somerset Dam is 50,000ML.

Wivenhoe Dam

At 0700 Thursday, Wivenhoe Dam was 67.31m and rising slowly. This is 0.31m above FSL and above the gate trigger level of 67.25m. There have been rises recorded at rivers and stream upstream of Wivenhoe Dam. The estimated event inflow volume into Wivenhoe Dam is 180,000ML including Somerset Dam outflow.

There has been significant rainfalls in the Lockyer Ck catchment since 0900 Thursday and a peak of about 600m³/s is expected from the Lockyer late Friday. Wivenhoe gates will be opened after flood levels in the lower Lockyer subside. At this stage Wivenhoe releases during Saturday may be as high as 1,500m³/s and continue for a couple of days.

APPENDIX E – SITUATION REPORTS (continued)

Impacts of Wivenhoe Dam Releases

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the potential for gate operations during the next 24 hours.

The will at least impact upon Twin Bridges, Savages Crossing, Kholo Bridge and Colleges Crossing for several days. The relatively high Lockyer flows will at least impact upon Twin Bridges, Savages Crossing, Kholo Bridge and Colleges Crossing for several days and may impact upon Burtons Bridge early Saturday. At this stage, there are not expected to be any adverse impacts upon Fernvale Bridge or Mt Crosby Weir Bridge.

Leslie Harrison Dam

Following the heavy rainfall Wednesday night, gate operations commenced at Leslie Harrison Dam late Wednesday night and are continuing. Given the forecast rainfall, gate operations are expected to continue for the next 24 to 48 hours.

The next situation report will be issued at 1800 Thursday 6/1/2011.

APPENDIX E – SITUATION REPORTS (continued)

Situation Report 3

Date: Thursday 6 January 2011

Time: 17:33

From: Duty Engineer

Sent: Thursday, 6 January 2011 5:33 PM

To: Distribution List

Subject: Situation Report 1800 06/01/2011

Rainfall

In the 8 hours since 9am Wednesday, there have been general totals around 30mm with isolated heavy falls up to 60mm in the Somerset and Wivenhoe catchments. There have been significant rainfalls in the Lockyer Ck catchment in the last 24 hours with widespread falls of 50mm and isolated falls up to 75mm. Totals in the North Pine catchment have generally been about 30mm. Falls between 20 and 30mm were recorded in the Leslie Harrison catchment.

The forecast for the next 24 to 48 hours is for totals up to 100mm in SE Qld.

North Pine Dam

At 1700 Thursday, North Pine Dam was 39.68m, 0.03m above gate trigger level. Gate operations will commence at 1900 Thursday and will impact upon Youngs Crossing. Moreton Bay Regional Council has been advised and will confirm closure of Youngs Crossing prior to gate operations. Given the forecast rainfall during Friday, gate operations may continue into Saturday.

Somerset Dam

At 1700 Thursday, Somerset Dam was 99.45m, 0.45m above FSL, and rising slowly. The rain in the Stanley River catchment has produced a small amount of runoff in the upper Stanley but there have been significant rises in Kilcoy Ck, adding to the Somerset inflows. Further regulator/sluice operations will be required in the next 24 to 48 hours. The estimated event inflow volume into Somerset Dam is 50,000ML.

Wivenhoe Dam

At 1700 Thursday, Wivenhoe Dam was 67.39m and rising slowly. This is 0.39m above FSL and above the gate trigger level of 67.25m. Upstream of the dam river levels are still rising at the Linville and Gregors Ck gauges. The estimated event inflow volume into Wivenhoe Dam is 180,000ML including Somerset Dam outflow.

A peak of about 600m³/s is expected from the Lockyer late Friday. At this stage there is some uncertainty associated with this estimate and it may or may not impact Burtons Bridge. Wivenhoe gates will be opened after the impact of Lockyer flows on Burtons Bridge has been ascertained and flood levels in the lower Lockyer subside. At this stage Wivenhoe releases will commence late Friday/early Saturday and may be as high as 1,500m³/s, similar to recent events, and continue for a couple of days.

APPENDIX E – SITUATION REPORTS (continued)

Impacts of Downstream of Wivenhoe

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the potential for gate operations during the next 24 hours.

The relatively high Lockyer flows will adversely impact upon Twin Bridges, Savages Crossing, Kholo Bridge and Colleges Crossing for several days and may impact upon Burtons Bridge early Saturday. At this stage, there are not expected to be any adverse impacts upon Fernvale Bridge or Mt Crosby Weir Bridge.

Leslie Harrison Dam

Following the heavy rainfall Wednesday night, gate operations commenced at Leslie Harrison Dam late Wednesday night and are continuing. Given the forecast rainfall, gate operations are expected to continue for the next 24 to 48 hours.

The next situation report will be issued at 0600 Friday 7/1/2011.

APPENDIX E – SITUATION REPORTS (continued)

Situation Report 5

Date: Friday 7 January 2011

Time: 17:57

From: Duty Engineer
Sent: Friday, 7 January 2011 5:57 PM
To: Distribution List
Subject: Situation Report 1800 Friday 07/01/2011

Rainfall

Since 0900 Friday, there has been widespread 20 to 40mm throughout North Pine, Somerset and Wivenhoe catchments with isolated higher totals of 70mm in the upper reaches of the Brisbane R.

Advice from BoM indicates that SE Qld can expect further high rainfall totals over the next 4 days.

Saturday: Rain light at times 15-50mm with higher falls along the coast
Sunday: Widespread rain with totals between 50-100mm
Monday: Widespread rain again with totals between 50-100mm
Tuesday: Rain easing with totals between 25-50mm

Given the saturated conditions of the catchments, significant inflows to Seqwater dams will be generated, especially following the forecast rainfall on Sunday/Monday

North Pine (Full Supply Level 39.60 m AHD)

At 1700 Friday, North Pine currently has 5 gates open releasing runoff from rain on Wed/Thursday. Given the very high likelihood of significant runoff during the next 4 days, gates will be kept open to match inflows over the next few days, rather than opening and closing at various times with short notice. Youngs Crossing will remain adversely impacted for the duration of the gates being open. Moreton Bay Regional Council has been advised and concurs with this strategy.

Somerset (Full Supply Level 99.00 m AHD)

At 1700 Friday, Somerset Dam level was 100.04m AHD and rising steadily with one regulator open 100%. However, as the Wivenhoe headwater level is rising and may impact upon the operation of the regulator, this will be closed in the next few hours and a sluice gate opened. However, this strategy may need to be reviewed if significant runoff occurs in the Stanley and Upper Brisbane. Under circumstances of high inflows to Somerset and Wivenhoe, it is the usual practice to hold flood water in Somerset until there is a high level of confidence in the estimated inflows to Wivenhoe.

Since the commencement of the event on 02/01/2011, approximately 55,000ML has flowed into Somerset Dam with a further 25,000ML expected based on the recorded rainfall to date. Approximately 16,000ML has been released into Wivenhoe.

Wivenhoe (Full Supply Level 67.00 m AHD)

At 1700 Friday, Wivenhoe Dam was 68.10 m AHD and rising steadily with one gate open to 1.5 metres and releasing about 168m³/s. River levels upstream of Wivenhoe Dam were rising again, generating further inflow to the dam. It is intended to ramp up the release from Wivenhoe to about 1,200m³/s during the next 18 hours. However, given the high likelihood of significant inflows in the next week, this may be increased later on the weekend.

Since the commencement of the event on 02/01/2011, approximately 140,000ML has flowed into Wivenhoe Dam with a further 160,000ML expected (including Somerset release) based on the recorded rainfall to date. Approximately 24,000ML has been released from Wivenhoe via the hydro and regulator at about 50m³/s.

Impacts downstream of Wivenhoe

The projected Wivenhoe release of 1,200m³/s combined with Lockyer flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Savages Crossing, Burtons Bridge, Kholo Bridge and Colleges Crossing) will be adversely impacted for several days. At this stage Fernvale and Mt Crosby Weir Bridge are not expected to be affected.

Discussions were held with Brisbane City Council and BoM with all agencies agreeing that the combined flow in the lower Brisbane R will only add 50mm to an upper limit of 100mm to the recorded water levels in the City Reach of the Brisbane River. However, it is noted that tides in the lower Brisbane R will be 0.4 to 0.5 metres higher than predicted tides.

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the Wivenhoe operating strategy.

Leslie Harrison

Given its proximity to the coast Leslie Harrison is likely to be most impacted by the forecast rain over the next 4 days.

APPENDIX E – SITUATION REPORTS (continued)

Situation Report 7

Date: Saturday 8 January 2011

Time: 06:32

From: Duty Engineer

Sent: Saturday, 8 January 2011 6:32 AM

To: Distribution List

Subject: Situation Report 0600 Saturday 08/01/2011

Rainfall

Since 0900 Friday, there has been widespread 20 to 40mm throughout North Pine, Somerset and Wivenhoe catchments with isolated higher totals of 70mm in the upper reaches of the Brisbane R. No significant rain has fallen in the past 12 hours.

Advice from BoM indicates that SE Qld can expect further high rainfall totals over the next 4 days.

Saturday: Rain light at times 5-50mm with higher falls along the coast

Sunday: Widespread rain with totals between 50-100mm

Monday: Widespread rain again with totals between 50-100mm

Tuesday: Rain easing with totals between 25-50mm

Given the saturated conditions of the catchments, significant inflows to Seqwater dams will be generated, especially following the forecast rainfall on Sunday/Monday

North Pine (Full Supply Level 39.60 m AHD)

At 0600 Saturday, North Pine Lake Level was 39.46 m AHD and slowly rising. Currently 3 gates are open to release runoff from rain on Wed/Thursday/Friday. Given the very high likelihood of significant runoff during the next 4 days, gates will be kept open to match inflows over the next few days, rather than opening and closing at various times with short notice. Youngs Crossing will remain adversely impacted for the duration of the gates being open. Moreton Bay Regional Council has been advised and concurs with this strategy.

Somerset (Full Supply Level 99.00 m AHD)

At 0500 Saturday, Somerset Dam level was 100.42m AHD and rising. The Dam is releasing into Wivenhoe through one open sluice gate. Water will be temporarily held in Somerset to allow the inflow from the upper Brisbane to be passed through the system. However, this strategy may need to be reviewed if significant runoff occurs in the Stanley and Upper Brisbane. Under circumstances of high inflows to Somerset and Wivenhoe, it is the usual practice to hold flood water in Somerset until there is a high level of confidence in the estimated inflows to Wivenhoe.

Since the commencement of the event on 02/01/2011, approximately 85,000ML has flowed into Somerset Dam with a further 20,000ML expected based on the recorded rainfall to date. Approximately 25,000ML has been released into Wivenhoe.

Wivenhoe (Full Supply Level 67.00 m AHD)

APPENDIX E – SITUATION REPORTS (continued)

At 0600 Saturday, Wivenhoe Dam was 68.45 m AHD and rising steadily with all five gates open and releasing about 890 m³/s. River levels upstream of Wivenhoe Dam were rising again, generating further inflow to the dam. It is intended to ramp up the release from Wivenhoe to 1,200m³/s by midday Saturday 08/01/2011. Further assessments will be undertaken to determine increases above this level. However, given the high likelihood of significant inflows in the next week, this may be increased.

Since the commencement of the event on 02/01/2011, approximately 200,000ML has flowed into Wivenhoe Dam (including Somerset releases) with a further 180,000ML expected based on the recorded rainfall to date. Approximately 50,000ML has been released from Wivenhoe via the hydro and regulator at about 50m³/s.

Impacts downstream of Wivenhoe

The projected Wivenhoe release of 1,200m³/s combined with Lockyer flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Savages Crossing, Burtons Bridge, Kholo Bridge and Colleges Crossing) will be adversely impacted for several days. At this stage Fernvale and Mt Crosby Weir Bridge are not expected to be affected but they could potentially be affected if the predicted rainfall totals eventuate.

The current available assessments indicate that the combined flow in the lower Brisbane R would only add 50mm to an upper limit of 100mm to the recorded water levels in the City Reach of the Brisbane Rive. However, it is noted that tides in the lower Brisbane R will be 0.4 to 0.5 metres higher than predicted tides.

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the Wivenhoe operating strategy.

APPENDIX E – SITUATION REPORTS (continued)

Situation Report 8

Date: Saturday 8 January 2011

Time: 14:22

From: Duty Engineer

Sent: Saturday, 8 January 2011 2:22 PM

To: Distribution List

Subject: Seqwater Situation Report at 12:00 on Saturday 8 January 2011

Dam Safety Regulator

I have added you to the distribution list of the Situation Report for Seqwater dams. This is distributed every 12 hours (approximately) during gate releases. Let me know if you do not wish to get this.

Rainfall

No significant rain has fallen over the dam catchments in the past 18 hours.

Advice from BoM indicates that SE Qld can expect further high rainfall totals over the next 4 days.

Saturday: Rain light at times 5-50mm with higher falls along the coast
Sunday: Widespread rain with totals between 50-100mm
Monday: Widespread rain again with totals between 50-100mm
Tuesday: Rain easing with totals between 25-50mm

Given the saturated conditions of the catchments, significant inflows to Seqwater dams will be generated, especially following the forecast rainfall on Sunday/Monday.

North Pine (Full Supply Level 39.60 m AHD)

At 1200 Saturday, North Pine Lake Level was 39.46 m AHD and is steady. Currently 2 gates are open to release runoff generated from rainfall over the last three days. Given the very high likelihood of significant runoff during the next 4 days, gates will be kept open to match inflows over the next few days, rather than opening and closing at various times with short notice. Lake Kurwongbah spillway flows are also contributing to the adverse impacts experienced at Youngs Crossing.

Youngs Crossing will remain adversely impacted for the duration of the gates being open.

Moreton Bay Regional Council has been advised and concurs with this strategy.

Somerset (Full Supply Level 99.00 m AHD)

At 1000 Saturday, Somerset Dam level peaked at 100.47m AHD and is now slowly falling. At 1200 it is now 100.45m. Somerset Dam is releasing into Wivenhoe through two open sluice gates and over the fixed crest at a rate of about 415 m³/s.

Since the commencement of the event on 02/01/2011, approximately 91,000ML has flowed into Somerset Dam with a further 20,000ML expected based on the recorded rainfall to date. Approximately 29,000ML has been released into Wivenhoe.

APPENDIX E – SITUATION REPORTS (continued)

Wivenhoe (Full Supply Level 67.00 m AHD)

At 1200 Saturday, Wivenhoe Dam was 68.60 m AHD and rising steadily with all five gates open and releasing about 1,150 m³/s. River levels upstream of Wivenhoe Dam have peaked and are now receding. However the further inflows into the dam has led to elevated levels. It is intended to increase the release from Wivenhoe to 1,250 m³/s by 14:00 on Saturday 08/01/2011. This will maintain flows of up to 1,600 m³/s in the mid-Brisbane River throughout the afternoon.

Further assessments will be undertaken to determine increases above this level given the high likelihood of significant inflows in the next few days. The interaction with runoff from the Bremer River and Warrill Creek catchment will also be assessed to determine an appropriate release strategy. Projections based upon the forecast rainfalls suggest flows of up to 1,200 m³/s will emanate from the Bremer River catchment.

Since the commencement of the event on 02/01/2011, approximately 202,000ML has flowed into Wivenhoe Dam (including Somerset releases) with a further 210,000ML expected based on the recorded rainfall to date. Approximately 66,000ML has been released from Wivenhoe via the radial gates, hydro and regulator.

Impacts downstream of Wivenhoe

The projected Wivenhoe release of 1,250m³/s and combined with Lockyer flows and local runoff will mean that all low level crossings downstream of Wivenhoe (Twin Bridges, Savages Crossing, Burtons Bridge, Kholo Bridge and Colleges Crossing) will be adversely impacted for several days. At this stage Fernvale and Mt Crosby Weir Bridge are not expected to be affected, but they could potentially be affected if the predicted rainfall totals eventuate and higher releases from Wivenhoe Dam are considered necessary.

The current available assessments indicate that the combined flow in the lower Brisbane River would only add 50mm to an upper limit of 100mm to the recorded water levels in the City Reach of the Brisbane River. However, it is noted that tides in the lower Brisbane R will be 0.4 to 0.5 metres higher than predicted tides. The tide level at the Port Office Gauge at 1200 Saturday was 1.56 m and rising.

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the Wivenhoe operating strategy.

APPENDIX E – SITUATION REPORTS (continued)

Situation Report 9

Date: Sunday 9 January 2011

Time: 06:15

From: Duty Engineer

Sent: Sun 9/01/2011 6:15 AM

To: Distribution List

Subject: FOC Situation Report at 06:00 on Sunday 9 January 2011

Rainfall

Catchment average rainfall for the past 12 hours is; North Pine Dam (less than 10 mm); Somerset Dam (40 mm); Wivenhoe Dam (less than 10 mm). The bulk of the rain that has fallen in the Somerset Dam catchment has occurred in the last two hours, with recorded falls exceeding 60mm in some areas. The BOM forecast for the next seven days issued at 0450 this morning is:-

Sunday:	Rain periods.
Monday:	Rain periods.
Tuesday:	Rain periods.
Wednesday:	A few showers.
Thursday:	A shower or two.
Friday:	A shower or two.
Saturday:	Mostly fine.

A severe weather warning remains current for heavy rainfall in the dam catchment areas. The dam catchments are relatively saturated and significant inflows will be generated if the forecast rainfall eventuates.

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level is currently 39.47 m AHD and steady. Two radial gates remain open to release runoff generated from recent rainfall. Based on rainfall forecasts, the radial gates have been kept open in anticipation of further inflows over the next few days. However unless significant rain falls today, consideration will be given to closing the gates late this afternoon or early tomorrow morning and discussions to finalise a decision on the timing of radial gate closure will be held with the Moreton Bay Regional Council later today. Youngs crossing will remain closed while releases are in progress.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is currently falling slowly, with the current level being 100.27m AHD. However the rain that has fallen in the dam catchment over the last two hours (recorded falls exceed 60mm in some areas) will result in significant inflows later today. The current release rate into Wivenhoe Dam is 35,000ML/day. Since the commencement of the event on 02/01/2011 approximately 56,000ML has been released from the dam, with a total of at least 150,000ML to be released based on the currently recorded rainfall. The total release for the event is likely to increase significantly over the next few days based on the current rainfall forecasts. At this stage, releases will continue until at least Tuesday.

APPENDIX E – SITUATION REPORTS (continued)

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

The dam level is currently falling slowly, with the current level being 68.58m AHD. River levels upstream of the dam are receding, however further inflows will result from any additional rainfall. The current gate operation strategy will maintain flows of around 1,600m³/s in the mid-Brisbane River. The current release rate from Wivenhoe Dam is 116,000ML/day. Since the commencement of the event on 02/01/2011 approximately 150,000ML has been released from the dam, with a total of at least 450,000ML to be released based on the currently recorded rainfall. The total release for the event is likely to increase over the next few days based on the current rainfall forecasts. At this stage, releases will continue until at least Wednesday.

Impacts downstream of Wivenhoe Dam

The current Wivenhoe Dam release combined with Lockyer flows and local runoff will mean that all low level crossings downstream of Wivenhoe (Twin Bridges, Savages Crossing, Burtons Bridge, Kholo Bridge and Colleges Crossing) will be adversely impacted until at least Wednesday 12 January. At this stage Fernvale and Mt Crosby Weir Bridge are not expected to be affected, but this may be revised if the predicted rainfall totals eventuate and higher releases from Wivenhoe Dam are considered necessary.

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the Wivenhoe operating strategy.

APPENDIX E – SITUATION REPORTS (continued)

Situation Report 10

Date: Sunday 9 January 2011

Time: 17:51

From: Duty Engineer
Sent: Sunday, 9 January 2011 5:51 PM
To: Distribution List
Cc: Distribution List
Subject: Situation Report 1700 Sunday 9/1/2011

Rainfall

Catchment average rainfall for the past 12 hours is; North Pine Dam (60 mm); Somerset Dam (150 mm); Wivenhoe Dam (80 mm). The bulk of the rain that has fallen in the upper reaches of the Stanley and Brisbane Rivers.

The BOM rainfall forecast for the next few days is:-

Monday:	Very heavy rain periods with totals up to 300mm centred around North Pine.
Tuesday:	Rain periods with totals up to 150mm centred around North Pine.
Wednesday:	A few showers less than 10mm
Thursday:	A shower or two.
Friday:	A shower or two.
Saturday:	Mostly fine.

A severe weather warning remains current for heavy rainfall in the dam catchment areas. The dam catchments are relatively saturated and significant inflows will be generated if the forecast rainfall eventuates.

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level is currently 39.65 m AHD and rising at 1600. Following the rain in the 9 hours, the number of open gates has been increased from 2 to 5 which are expected to remain open for the next 12 hours. Youngs Crossing will remain closed while releases are in progress.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 100.75 m AHD and rising quickly. Estimated peak inflow to the dam is about 3,000m³/s. Five sluice gates are open releasing about 1,100m³/s (95,000ML/d) into Wivenhoe Dam. At this stage the dam will reach at least 101.5 during early Tuesday morning.

Since the commencement of the event on 02/01/2011 approximately 80,000ML has been released from the dam, with an event total of at least 320,000ML based on the recorded rainfall to date. The event total is expected to increase significantly due to the forecast rain in the next 24 to 48 hours. At this stage, releases will continue until at least Wednesday.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

APPENDIX E – SITUATION REPORTS (continued)

The dam level is currently rising again, with the current level being 68.70m AHD. Estimated peak inflow to the dam just from the Upper Brisbane R is about 5,000m³/s and, at this stage, the dam will reach at least 72.5 m AHD during Wednesday morning. River levels upstream of the dam are rising quickly with significant inflow being generated from the intense heavy rainfall. The current gate operation strategy will maintain flows of around 1,600m³/s in the mid-Brisbane River for the next 24 hours. This may mean temporarily reducing releases from Wivenhoe Dam as Lockyer flows increase. However, releases may have to be increased significantly during Monday depending on the rain in the next 12 to 24 hours. The current release rate from Wivenhoe Dam is 1,400m³/s (120,000ML/day).

Since the commencement of the event on 02/01/2011 approximately 210,000ML has been released from the dam, with an event total approaching 1,000,000ML (including Somerset outflow) based on the recorded rainfall to date. The total release for the event is likely to increase over the next few days based on the current rainfall forecasts. At this stage, releases will continue until at least Saturday 15th January 2011.

Impacts downstream of Wivenhoe Dam

The current Wivenhoe Dam release combined with Lockyer flows and local runoff will mean that all low level crossings downstream of Wivenhoe (Twin Bridges, Savages Crossing, Burtons Bridge, Kholo Bridge and Colleges Crossing) will be adversely impacted until at least Saturday 15 January.

At this stage Fernvale and Mt Crosby Weir Bridge will not be affected for the next 24 hours but there is a strong possibility that, if the predicted rainfall totals eventuate in the next 12 to 24 hours, higher releases from Wivenhoe Dam will be necessary. This may adversely impact upon Fernvale and Mt Crosby Weir Bridges as early as Tuesday morning.

Water levels in the lower Brisbane R will be impacted by the combined flows of Lockyer Ck, Bremer River, local runoff and releases from Wivenhoe Dam.

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the Wivenhoe operating strategy.

APPENDIX E – SITUATION REPORTS (continued)

Situation Report 11

Date: Sunday 9 January 2011

Time: 21:04

From: Duty Engineer
Sent: Sunday, 9 January 2011 9:04 PM
To: Distribution List
Cc: Distribution List
Subject: Situation Report 2100 9/01/2011
Importance: High

Rainfall

Very heavy rainfall has been recorded in the upper reaches of the Brisbane and Stanley in the last 6 hours with totals up 100 to 140mm. Totals for the last 24 hours range from 100 to 300mm.

Rainfall of similar magnitudes is expected in the 12 to 24 hours, especially around the Bremer/Warrill catchments as the system tracks south.

A severe weather warning remains current for heavy rainfall in the dam catchment areas.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 101.68 m AHD (about 500,000ML currently in storage) and rising quickly. Peak inflow to the dam is estimated to be about 4,000 m³/s based on observed rainfall and could be as high as 5,000m³/s with additional forecast rainfall. Five sluice gates are open releasing about 1,100m³/s (95,000ML/d) into Wivenhoe Dam. At this stage the dam will reach at least 103.5 early Tuesday morning which will adversely impact areas around Kilcoy.

Since the commencement of the event on 02/01/2011 approximately 100,000ML has been released from the dam into Wivenhoe, with an event total of the order of 520,000ML expected. This may increase due to the forecast rain in the next 24 to 48 hours. At this stage, releases will continue until at least Thursday.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

River levels upstream of the dam are rising quickly with significant inflow being generated from the intense heavy rainfall. Flows in the Brisbane River at Gregor's Ck have already reached 6,700m³/s and the river is still rising.

The dam level is rising again, with the current level being 69.10m AHD (1,410,000ML with about 300,00 of flood storage). Estimated peak inflow to the dam just from the Upper Brisbane R alone may reach as high as 7,500m³/s and, at this stage, the dam will reach at least 73.0 m AHD during Tuesday morning. Given the rapid increase in inflow volumes, it will be necessary to increase the release from Wivenhoe Monday morning.

The objective for dam operations will be to minimise the impact of urban flooding in areas downstream of the dam and, at this stage, releases will be kept below 3,500m³/s and the

APPENDIX E – SITUATION REPORTS (continued)

combined flows in the lower Brisbane will be limited to 4,000m³/s. This is below the limit of urban damages in the City reaches.

The current release rate from Wivenhoe Dam is 1,400m³/s (120,000ML/day). Gate opening will start to be increased from noon Monday and the release is expected increase to at least 2,600m³/s during Tuesday morning.

Since the commencement of the event on 02/01/2011 approximately 220,000ML has been released from the dam, with an event total approaching 1,000,000ML without further rain and as much as 1,500,000ML with forecast rainfall of (both including Somerset outflow). At this stage, releases will continue until at least Sunday 16th January 2011.

Impacts downstream of Wivenhoe Dam

The projected Wivenhoe Dam releases combined with Lockyer flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Saturday 15 January in varying degrees.

Water levels in the lower Brisbane R will be impacted by the combined flows of Lockyer Ck, Bremer River, local runoff and releases from Wivenhoe Dam.

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the updated Wivenhoe operating strategy.

APPENDIX E – SITUATION REPORTS (continued)

Situation Report 12

Date: Monday 10 January 2011

Time: 01:14

From: Duty Engineer

Sent: Monday, 10 January 2011 1:14 AM

To: Distribution List

Cc: Distribution List

Subject: FOC Situation Report at 01:00 hrs on Monday 10 January 2011

Rainfall

Very heavy rainfall has been recorded in the Upper Brisbane and Stanley Rivers in the last 12 hours with totals up 100 to 240mm. Totals for the last 24 hours range from 100 to 300mm.

Rainfall of similar magnitudes is expected in the 12 to 24 hours around the downstream catchments as the system tracks south.

A severe weather warning remains current for heavy rainfall in the dam catchment areas.

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level was 39.95 m and steady. Five gates are open releasing 445 m³/s. The inflow into the dam since the commencement of the event is 42,000 ML. Estimated event volume is 57,000 ML assuming no further rainfall. Gate operations will continue until at least Tuesday 11 January 2011.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 102.22 m AHD and rising quickly (storing 157,000 ML above FSL). Peak inflow to the dam is estimated to be about 4,200 m³/s based on observed rainfall and could be as high as 5,000m³/s with additional forecast rainfall. Five sluice gates are open releasing about 1,100m³/s (95,000ML/d) into Wivenhoe Dam. At this stage the dam will reach at least 103.5 on Monday afternoon which will adversely impact areas around Kilcoy.

Since the commencement of the event on 02/01/2011 approximately 115,000ML has been released from the dam into Wivenhoe, with an event total of the order of 520,000ML expected. This is expected to increase due to the forecast rain in the next 24 to 48 hours. At this stage, releases will continue until at least Thursday.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

River levels upstream of the dam are rising quickly with significant inflow being generated from the intense heavy rainfall. Flows in the Brisbane River at Gregor's Ck have already reached 7,350m³/s and the river has just peaked at 23:00 on Sunday 9 January.

The dam level is rising quickly, with the current level being 69.60m AHD (storing 301,000 ML). Estimated peak inflow to the dam just from the Upper Brisbane R alone may reach

APPENDIX E – SITUATION REPORTS (continued)

as high as 8,800m³/s and, at this stage, the dam will reach at least 73.3 m AHD during Tuesday morning. Given the rapid increase in inflow volumes, it will be necessary to increase the release from Wivenhoe during Monday morning.

The objective for dam operations will be to minimise the impact of urban flooding in areas downstream of the dam and, at this stage, releases will be kept below 3,500m³/s and the combined flows in the lower Brisbane will be limited to 4,000m³/s if possible.

Fernvale Bridge approaches and Mt Crosby Weir Bridge have been inundated and both bridges are now closed or are in the process of being closed.

The current release rate from Wivenhoe Dam is 1,400m³/s (120,000ML/day). Gate opening will start to be increased during early Monday morning and the release is expected to increase to at least 2,600m³/s.

Since the commencement of the event on 02/01/2011 approximately 240,000ML has been released from the dam, with an event total approaching 1,500,000ML without further rain and as much as 2,100,000ML with forecast rainfall of (both including Somerset outflow). At this stage, releases will continue until at least Sunday 16th January 2011.

Impacts downstream of Wivenhoe Dam

The projected Wivenhoe Dam releases combined with Lockyer flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Saturday 15 January in varying degrees.

Water levels in the lower Brisbane R will be impacted by the combined flows of Lockyer Ck, Bremer River, local runoff and releases from Wivenhoe Dam. If the predicted rainfall eventuates in the downstream tributary catchments the resultant combined flows in the lower Brisbane may exceed the threshold of damaging discharge in the urban areas within the next 24 to 48 hours.

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the updated Wivenhoe operating strategy.

APPENDIX E – SITUATION REPORTS (continued)

Situation Report 13

Date: Monday 10 January 2011

Time: 06:30

From: Duty Engineer

Sent: Monday, 10 January 2011 6:30 AM

To: Distribution List

Cc: Distribution List

Subject: FOC Situation Report at 06:00 on Monday 10 January 2011

Rainfall

Moderate to heavy rainfall has been recorded in the Upper Brisbane and Stanley Rivers in the last 12 hours with totals up to 90 mm. Totals for the last 24 hours range from 100 to 325mm.

Mt Glorious recorded 100 mm in the last 12 hours.

Rainfall of similar magnitudes is expected in the 12 to 24 hours around the downstream catchments as the system tracks south.

A severe weather warning remains current for heavy rainfall in the dam catchment areas.

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level was 39.97 m and steady. Five gates are open releasing 475 m³/s. The inflow into the dam since the commencement of the event is 52,000 ML. Estimated event volume is 72,000 ML assuming no further rainfall. Gate operations will continue until at least Tuesday 11 January 2011.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level at 05:00 was 102.84 m AHD and rising (storing 193,000 ML above FSL). Peak inflow to the dam is estimated to be about 4,200 m³/s based on observed rainfall and could be as high as 5,000m³/s with additional forecast rainfall. Five sluice gates are open releasing about 1,100m³/s (95,000ML/d) into Wivenhoe Dam. At this stage the dam lake level will reach about 103.5 m AHD on Monday afternoon. Areas around Kilcoy will continue to be adversely affected.

Since the commencement of the event on 02/01/2011 approximately 142,000ML has been released from the dam into Wivenhoe, with an event total of the order of 520,000ML expected. This is expected to increase due to the forecast rain in the next 24 to 48 hours. At this stage, releases will continue until at least Thursday.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

River levels upstream of the dam have peaked and are falling slowly with significant inflow being generated from the intense heavy rainfall. Flows in the Brisbane River at Gregor's Ck have peaked at 7,350m³/s at 23:00 on Sunday 9 January. This peak is bigger than January 1974 and February 1999 at this location.

APPENDIX E – SITUATION REPORTS (continued)

The dam level is rising quickly, with the current level being 70.77m AHD (storing 450,000 ML). Estimated peak inflow to the dam just from the Upper Brisbane R is around 8,800m³/s and, at this stage, the dam will reach at least 73.3 m AHD during Tuesday morning. Given the rapid increase in inflow volumes, it was necessary to start to increase the release from Wivenhoe during Monday morning.

The objective for dam operations will be to minimise the impact of urban flooding in areas downstream of the dam and, at this stage, releases will be kept below 3,500m³/s and the combined flows in the lower Brisbane will be limited to 4,000m³/s if possible. This is significantly less than the current estimated combined pre-dam peak inflow of 12,000 m³/s.

Fernvale Bridge approaches and Mt Crosby Weir Bridge have been inundated and both bridges are now closed.

The current release rate from Wivenhoe Dam is 1,753m³/s (150,000ML/day). Gate opening will continue to be increased during Monday and the release is expected to increase to at least 2,600m³/s in the next 12 to 24 hours.

Since the commencement of the event on 02/01/2011 approximately 275,000ML has been released from the dam, with an event total approaching 1,600,000ML without further rain and as much as 2,100,000ML with forecast rainfall of (both including Somerset outflow). At this stage, releases will continue until at least Sunday 16th January 2011.

Impacts downstream of Wivenhoe Dam

The projected Wivenhoe Dam releases combined with Lockyer flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Saturday 15 January in varying degrees.

Water levels in the lower Brisbane R will be impacted by the combined flows of Lockyer Ck, Bremer River, local runoff and releases from Wivenhoe Dam. If the predicted rainfall eventuates in the downstream tributary catchments the resultant combined flows in the lower Brisbane may exceed the threshold of damaging discharge in the urban areas within the next 24 to 48 hours. Currently the estimate peak flow in the lower Brisbane River will be the highest since Wivenhoe Dam was completed in 1984 but still well below flows the 1974 levels. Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the updated Wivenhoe operating strategy.

Outlook

Heavy rainfall continues throughout South East Queensland and the situation could deteriorate rapidly over the next 24 hours. The flood operation centre will continue to monitor the situation and provide every six hours until the situation stabilizes.

Subject: FOC Situation Report at 12:00 on Monday 10 January 2011

Rainfall

Rainfall has continued in the dam catchments over the last 6 hours, with approximate catchment averages as follows: North Pine (30mm); Wivenhoe Dam (20mm); Somerset Dam (40mm). A severe weather warning remains current for heavy rainfall in the dam catchment areas. The QPF issued by BOM at 10:00 estimates rainfalls for the 24 hours to 10:00 Tuesday as North Pine Dam (75mm to 150mm); Wivenhoe/Somerset Dam Catchments (50mm – 100mm).

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level is 40.00m AHD and relatively steady (storing 9,000ML above FSL). Five gates are open and releasing 500 m³/s. The inflow into the dam since the commencement of the event is 63,000 ML. Estimated event volume is 77,000 ML assuming no further rainfall. Gate operations will continue until at least Wednesday 12 January 2011.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 103.11m AHD and rising (storing 210,000 ML above FSL). Peak inflow to the dam is estimated to be about 4,200 m³/s. Five sluice gates are open releasing about 1,100m³/s (95,000ML/day) into Wivenhoe Dam. At this stage the dam lake level will reach about 103.5m AHD on Monday afternoon. Areas around Kilcoy will continue to be adversely affected.

Since the commencement of the event on 02/01/2011 approximately 182,000ML has been released from the dam into Wivenhoe, with an event total of the order of 520,000ML expected. This is expected to increase due to the forecast rain in the next 24 to 48 hours. At this stage, releases will continue until at least Thursday 13 January 2011.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

The dam level is 71.95m AHD and rising quickly (storing 610,000 ML above FSL). Peak inflow to the dam is estimated to be about 8,800m³/s. Five radial gates are open releasing about 2000m³/s (170,000ML/day) into the Brisbane River. At this stage, the dam will reach about 73.5m AHD during Tuesday morning. Flows in the Brisbane River above the dam at Gregor's Creek peaked at 7,350m³/s and this peak is bigger than both the January 1974 and February 1999 flood events at this location.

The objective for dam operations is to minimise the impact of urban flooding in areas downstream of the dam and the current aim is to keep river flows in the lower Brisbane

APPENDIX E – SITUATION REPORTS (continued)

River below 3,500m³/s if possible. This is significantly less than the current estimated combined pre-dam peak inflow of 12,000m³/s.

Since the commencement of the event on 02/01/2011 approximately 325,000ML has been released from the dam, with an event total approaching 1,600,000ML without further rain and as much as 2,100,000ML with forecast rainfall of (both including Somerset outflow). At this stage, releases will continue until at least Sunday 16 January 2011.

The volume between the expected peak (73.5m AHD) and the level at which the safety of the dam becomes the primary objective in managing flood releases (74.0m AHD) is 75,000ML. The volume between the expected peak (73.5m AHD) and initiation of the first Fuse Plug is 330,000ML.

Impacts downstream of Wivenhoe Dam

The projected Wivenhoe Dam releases combined with Lockyer Creek flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Saturday 15 January in varying degrees.

Water levels in the lower Brisbane River will be impacted by the combined flows of Lockyer Creek, Bremer River, local runoff and releases from Wivenhoe Dam. If the predicted rainfall eventuates in the downstream tributary catchments the resultant combined flows in the lower Brisbane may exceed the threshold of damaging discharge in the urban areas within the next 24 to 48 hours. Currently the estimate peak flow in the lower Brisbane River will be the highest since Wivenhoe Dam was completed in 1984 but still well below flows the 1974 levels.

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the updated Wivenhoe operating strategy.

Outlook

Heavy rainfall continues throughout South East Queensland and the situation could deteriorate rapidly over the next 24 hours. The flood operation centre will continue to monitor the situation and provide every six hours until the situation stabilizes.

APPENDIX E – SITUATION REPORTS (continued)

Situation Report 15

Date: Monday 10 January 2011

Time: 18:43

From: Duty Engineer

Sent: Monday, 10 January 2011 6:43 PM

To: Distribution List

Cc: Distribution List

Subject: FOC Situation Report at 18:00 on Monday 10 January 2011

Rainfall

Only minor rainfall has been experienced in the North Pine Dam and Somerset Dam catchments with a catchment averages of less than 20mm.

However, significant rain has fallen in the Wivenhoe Dam catchment over the last 6 hours, with isolated falls exceeding 100mm. This rainfall has significantly increase inflows into the dam. A severe weather warning remains current for heavy rainfall in the dam catchment areas. The QPF issued by BOM at 10:00 estimates rainfalls for the 24 hours to 10:00 Tuesday as North Pine Dam (25mm to 50mm, with isolated falls to 100mm); Wivenhoe/Somerset Dam Catchments (25mm to 50mm, with isolated falls to 100mm). Potentially significant rain moving towards the dam catchments is currently evident on the BOM radar.

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level is 39.84m AHD and falling slowly (storing 9,000ML above FSL). Five gates are open and releasing 362 m³/s. The inflow into the dam since the commencement of the event is 72,000 ML. Estimated event volume is 84,000 ML assuming no further rainfall. Releases from the dam will continue until at least Wednesday 12 January 2011.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 103.46m AHD and rising slowly. Peak inflow to the dam is estimated to be about 4,200 m³/s. Total discharge into Wivenhoe Dam is currently 1700m³/s and this discharge will decrease slowly in the next 24 hours to be around 1200m³/s late Tuesday. The dam level will peak at 103.5m AHD in the next few hours, unless further significant rainfall is experienced. Areas around Kilcoy will continue to be adversely affected.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

The dam level is 72.92m AHD and rising quickly. Releases from the dam have been increased over the last 3 hours in accordance with Flood Mitigation procedures and to ensure that a fuse plug is not initiated. The initiation of a fuse plug will result in a rapid uncontrolled outflow from the dam of 2,000m³/s being added to the gate release outflow. Outflows into the Brisbane River from both Lockyer Creek and the Bremer River are also increasing. The flash flooding experienced in the upper areas of Lockyer Creek have been examined and are not expected to significantly increase Brisbane River flows above the current projection of 4000m³/s at Moggill.

APPENDIX E – SITUATION REPORTS (continued)

Five radial gates are currently open at the dam releasing about 2,400m³/s into the Brisbane River and this will need to be increased steadily to an outflow of 2,800m³/s. At this stage, the dam will reach about 73.8m AHD during Tuesday morning.

The objective for dam operations is currently to minimise the impact of urban flooding in areas downstream of the dam and to keep river flows in the lower Brisbane River below 4,000m³/s if possible. This is significantly less than the current estimated combined pre-dam peak inflow of 12,000m³/s. If further rainfall occurs, dam releases may need to be increased further and this may result in river flows in the lower Brisbane River approaching or exceeding 5,000m³/s.

Impacts downstream of Wivenhoe Dam

The projected Wivenhoe Dam releases combined with Lockyer Creek flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Sunday 16 January in varying degrees.

Water levels in the lower Brisbane River will be impacted by the combined flows of Lockyer Creek, Bremer River, local runoff and releases from Wivenhoe Dam.

Outlook

Heavy rainfall continues throughout South East Queensland and the situation could deteriorate rapidly over the next 24 hours. The flood operation centre will continue to monitor the situation and provide every six hours until the situation stabilizes.

APPENDIX E – SITUATION REPORTS (continued)

Situation Report 16

Date: Monday 10 January 2011

Time: 23:56

From: Duty Engineer

Sent: Monday, 10 January 2011 11:56 PM

To: Distribution List

Cc: Distribution List

Subject: FOC Situation Report at 00:00 Tuesday 11 January 2011

Rainfall

Rainfall continues in the North Pine Dam, Somerset Dam and Wivenhoe Dam catchments with falls of generally less than 20mm since 18:00 today. However, some isolated falls in the Upper Brisbane River of up to 110 mm have been recorded at Monsildale in this time. This rainfall will increase inflows into the dam.

A severe weather warning remains current for heavy rainfall in the dam catchment areas. The QPF issued by BOM at 16:00 estimates rainfalls for the 24 hours to 10:00 Tuesday as North Pine Dam (25mm to 50mm, with isolated falls to 100mm); Wivenhoe/Somerset Dam Catchments (25mm to 50mm, with isolated falls to 100mm).

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level is 39.80m AHD and falling slowly (storing 4,400ML above FSL). Five gates are open, releasing 153 m³/s. The inflow into the dam since the commencement of the event is 74,000 ML. Estimated event volume is 84,000 ML assuming no further rainfall. Releases from the dam will continue until at least Wednesday 12 January 2011.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 103.40m AHD and falling slowly. Peak inflow to the dam is estimated to be about 4,200 m³/s. Total discharge into Wivenhoe Dam is currently 1700m³/s and this discharge will decrease slowly in the next 24 hours to be around 1200m³/s late Tuesday. The dam level peaked at 103.52m AHD at 19:00 on Monday 10 January 2011, unless further significant rainfall is experienced. Areas around Kilcoy will continue to be adversely affected.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

The dam level is 73.22m AHD and rising at about 50 mm/hour. Releases from the dam have been held at a rate of 2,750 m³/s since 19:30 hours. Outflows into the Brisbane River from both Lockyer Creek and the Bremer River are also increasing.

The BoM has provided further advice about the flash flooding experienced in the upper areas of Lockyer Creek. The rainfall responsible for this event was not observed at any rainfall stations but it is considered to be very significant. Flood levels in the Lockyer Creek catchment will exceed maximum recorded levels in some stations in the upper catchment. This flow may result in increases in Brisbane River levels below the junction of Lockyer Creek.

APPENDIX E – SITUATION REPORTS (continued)

Five radial gates are currently open at the dam releasing about 2,750m³/s into the Brisbane River. At this stage, the dam will reach about 73.8m AHD during Tuesday afternoon.

The objective for dam operations is currently to minimise the impact of urban flooding in areas downstream of the dam and to keep river flows in the lower Brisbane River below 4,000m³/s if possible. This is significantly less than the current estimated combined pre-dam peak inflow of 12,000m³/s. If further rainfall occurs, dam releases may need to be increased further and this may result in river flows in the lower Brisbane River approaching or exceeding 5,000m³/s.

Impacts downstream of Wivenhoe Dam

The projected Wivenhoe Dam releases combined with Lockyer Creek flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Sunday 16 January in varying degrees.

Water levels in the lower Brisbane River will be impacted by the combined flows of Lockyer Creek, Bremer River, local runoff and releases from Wivenhoe Dam.

The BoM will provide further information regarding the magnitude of the flash flood event occurring in Lockyer Creek early Tuesday morning. Consideration will be given to modifying the releases from Wivenhoe Dam to try to moderate the peak flows emanating from Lockyer Creek.

Outlook

Heavy rainfall continues throughout South East Queensland and the situation could deteriorate over the next 24 hours. The flood operation centre will continue to monitor the situation and provide situation reports every six hours until the situation stabilizes.

Regards

APPENDIX E – SITUATION REPORTS (continued)

Situation Report 17

Date: Tuesday 11 January 2011

Time: 06:12

From: Duty Engineer

Sent: Tuesday, 11 January 2011 6:12 AM

To: Distribution List

Cc: Distribution List

Subject: FOC Situation Report at 06:00 on Tuesday 11 January 2011

Rainfall

Rainfall continues in the North Pine Dam, Somerset Dam and Wivenhoe Dam catchments. Isolated falls in the Upper Brisbane River of up to 125 mm have been recorded with widespread falls of 40 to 70 mm in the Somerset Dam catchment. This rainfall will increase inflows into the dam.

There has also been 20 to 60 mm in the Lockyer Creek catchment in the last 12 hours with falls of up to 30 mm in the Bremer River.

A severe weather warning remains current for heavy rainfall in the dam catchment areas.

The QPF issued by BOM at 16:00 estimates rainfalls for the 24 hours to 10:00 Tuesday as North Pine Dam (25mm to 50mm, with isolated falls to 100mm); Wivenhoe/Somerset Dam Catchments (25mm to 50mm, with isolated falls to 100mm).

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level is 39.80m AHD and has commenced rising again (storing 4,400ML above FSL). Five gates are open releasing 177 m³/s. The inflow into the dam since the commencement of the event is 77,000 ML. Estimated event volume is 88,000 ML assuming no further rainfall. Releases from the dam will continue until at least Wednesday 12 January 2011.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 103.27m AHD and falling slowly. Peak inflow to the dam is estimated to be about 4,200 m³/s. Total discharge into Wivenhoe Dam is currently 1400 m³/s and this discharge will be decreased in the next few hours to be around 500 m³/s later on Tuesday. This is to ensure that the combined flood mitigation capacity in Somerset and Wivenhoe Dam is maximized.

The dam level peaked at 103.52m AHD at 19:00 on Monday 10 January 2011, (unless further significant rainfall is experienced). Areas around Kilcoy will continue to be adversely affected.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

The dam level is 73.51m AHD and rising at about 25 mm/hour. Releases from the dam have been held at a rate of 2,750 m³/s since 19:30 hours on Monday 10 January 2011. Outflows into the Brisbane River from both Lockyer Creek and the Bremer River are also increasing.

APPENDIX E – SITUATION REPORTS (continued)

The BoM has provided further advice about the flash flooding experienced in the upper areas of Lockyer Creek. The rainfall responsible for this event was not observed at any rainfall stations but it is considered to be extreme. Flood levels in the Lockyer Creek catchment will exceed maximum recorded levels in some stations in the upper catchment. This flow will result in increases in Brisbane River levels below the junction of Lockyer Creek.

Five radial gates are currently open at the dam releasing about 2,750m³/s into the Brisbane River. At this stage, the dam will reach just over 74.0m AHD during Tuesday evening.

Above EL 74.0m AHD the objective for dam operations is to maintain the security of the dam and minimise downstream flood flows if possible.

If further rainfall occurs, dam releases may need to be increased further and this may result in river flows in the lower Brisbane River approaching or exceeding 5,000m³/s.

Impacts downstream of Wivenhoe Dam

The projected Wivenhoe Dam releases combined with Lockyer Creek flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Sunday 16 January in varying degrees.

Water levels in the lower Brisbane River will be impacted by the combined flows of Lockyer Creek, Bremer River, local runoff and releases from Wivenhoe Dam.

The BoM will provide further information regarding the magnitude of the flash flood event occurring in Lockyer Creek early Tuesday morning. Consideration was given to modifying the releases from Wivenhoe Dam to try to moderate the peak flows emanating from Lockyer Creek but the rainfall in the past 12 hours in the catchment above the dam makes this option not possible. Therefore instead of decreasing releases to accommodate the Lockyer Creek flows, the strategy will endeavour to maintain the current releases until Lockyer Creek peaks.

Outlook

Heavy rainfall continues throughout South East Queensland and the situation could deteriorate over the next 24 hours. The flood operation centre will continue to monitor the situation and provide situation reports every six hours until the situation stabilizes.

APPENDIX E – SITUATION REPORTS (continued)

Situation Report 18

Date: Tuesday 11 January 2011

Time: 12:11

From: Duty Engineer
Sent: Tuesday, 11 January 2011 12:11 PM
To: Distribution List
Subject: SitRep 1200 11/1/2011

Somerset/Wivenhoe

Our current strategy revolves around trying to prevent initiation of the first fuse plug at EL 75.6m. If this happens we will get a rapid increase of about 2,000m³/s in outflow from the dam in addition to the gate release which could be as high as 4,500 to 5,000m³/s at the time. However, it may be that fuse plug initiation might provide a lower outflow than increasing the gate outflow to protect it. In this case, we would adopt an alternate scenario.

Sluices have been closed at Somerset and this will result in high upstream water levels affecting Kilcoy.

1. With no further rainfall, Wivenhoe will approach 75.0m AHD and there will be an attempt to limit the dam outflow to 4,500m³/s, however this strategy currently being reviewed on an hour by hour basis. The release will be 4,000m³/s by 1300.
2. With 50mm rainfall in the Stanley and Upper Brisbane in the next 12 to 24 hours, the release will need to be significantly increased to be in the order 6,000m³/s.

It should be noted that the flow in the lower Brisbane River in 1974 was about 9,500m³/s

Wivenhoe has lost incoming mains power and are on backup power. Energex are attempting to rectify.

North Pine

Inflows and outflows are increasing very rapid and will exceed 2,000m³/s.

APPENDIX E – SITUATION REPORTS (continued)

Situation Report 19

Date: Tuesday 11 January 2011

Time: 18:00

From: Duty Engineer

Sent: Tuesday, 11 January 2011 6:00 PM

To: Distribution List

Subject: Situation Report 1800 12 January 2011

In the last twelve hours totals of up to 370mm have fallen in the area around Wivenhoe Dam. In the last hour, rainfalls between 15 and 30mm have been recorded in the same area. At 1600, the BoM advised that falls between 50 to 100mm are still forecast for the 24hrs to 1600 Wednesday 12 January 2011 for the North Pine and Somerset/Wivenhoe catchments.

At 1730 Wivenhoe Dam was 74.92m AHD and rising slowly and releasing about 6,700m³/s.

The current expectation is that the dam will reach a steady state (outflow equals inflow) within the next 3 hours without further significant rainfall. At this time, release from the dam will be about 8,000 m³/s.

If there is no further rainfall, it may be possible to then slowly reduce this release overnight.

The dam is expected to peak below 75.5m AHD which is 100mm below the first fuse plug initiation level.

Note that the automatic recorder as indicated on the BoM website is affected by drawdown and is not reflecting the actual lake level and tendency.

The Flood Operations Centre is continuing to monitor rainfalls and water levels through the Brisbane and Pine catchments and reviewing operating strategy every 30 minutes. The FOC is also maintaining close contact with warning agencies and local councils.

The next report will be issued at 2100 12 January 2011.

APPENDIX E – SITUATION REPORTS (continued)

Situation Report 20

Date: Wednesday 12 January 2011

Time: 05:49

From: Duty Engineer

Sent: Wednesday, 12 January 2011 5:49 AM

To: Distribution List

Subject: Situation Report 0600 Wed 12/01/2011

No significant rain has fallen over the catchments in the past twelve hours. Less than 10 to 15 millimeters of rainfall is expected over the next 24-48 hours.

Wivenhoe Dam peaked on the 11th January, Tuesday night at 19:00 at 74.97 mAHD with a corresponding discharge of 7,450 m³/s. The release have now been scaled back to 4,300m³/s at 05:00 am. Wivenhoe Dam is currently 74.77 m AHD and falling slowly.

The releases from Wivenhoe Dam will be temporarily reduced to 2,500 m³/s to allow the peak of Lockyer Creek to enter the Brisbane River, after which they will be increased to maximum of 3,500 m³/s. This release will then be maintained to drain the flood storage component within the required 7 days.

Somerset Dam is at 105.10 mAHD and slowly rising. The dam is discharging 1,230 m³/s over the spillway. The dam is expected to peak this morning near its current level. Sluice gates will be utilised to assist the draining of the flood storage compartment commencing on Thursday. The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2 million megalitres.

North Pine Dam is currently releasing 105 m³/s through five gates. At 17:00 the lake was 39.78 mAHD. The event has a volume of around 200,000 ML. The peak discharge from the dam was 2,800 m³/s. This is categorised as an extreme event in the order of 1 in 10,000.

The Flood Operations Centre is continuing to monitor rainfalls and water levels through the Brisbane and Pine catchments and reviewing operating strategy every 30 minutes. The FOC is also maintaining close contact with warning agencies and local councils.

The next report will be issued at 08:00 12 January 2011.

Rainfall

No significant rain has fallen over the catchments in the past twelve hours. Less than 10 to 15 millimeters of rainfall is expected over the next 24-48 hours.

Somerset/Wivenhoe

Somerset Dam has peaked at 105.11 mAHD at 06:00 on 12 January 2011 and the dam is discharging 1,230 m³/s over the spillway. Sluice gates will be utilised to assist the draining of the flood storage compartment commencing later Wednesday.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s. Wivenhoe Dam was 74.75 m AHD at 07:30 and generally falling slowly.

The releases from Wivenhoe Dam have been temporarily reduced to 2,500 m³/s at 07:30 to allow the peak of Lockyer Creek to enter the Brisbane River. After the downstream peak in the lower Brisbane River has passed, releases will be increased to maximum of 3,500 m³/s. This release will then be maintained to drain the flood storage component within the required 7 days.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2 million megalitres.

North Pine

At 07:00 North Pine Dam was 39.78 mAHD falling and releasing about 105 m³/s. North Pine has peaked at 41.11 mAHD at 14:00 on 11 January 1974 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML. It is expected that gates will be close later Wednesday or early Thursday.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels through the Brisbane and Pine catchments and reviewing operating strategy every 30 minutes. The FOC is maintaining close contact with warning agencies and local councils.

The next report will be issued at 12:00 12 January 2011.

Rainfall

Rainfall in the last 12 hours is generally below 5mm with a couple of 10mm falls in the Stanley and North Pine catchments. There is no significant rain expected in the next 4 days.

Somerset/Wivenhoe

Somerset Dam has peaked at 105.11 mAHD at 06:00 on 12 January 2011. One sluice was opened at 1030 12 January 2011 and the dam is discharging 1,440 m³/s. Sluice gates will be utilised to drain of the flood storage compartment during the next 5 days.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s. Wivenhoe Dam was 74.81 m AHD at 15:00 and steady.

The releases from Wivenhoe Dam have been temporarily reduced to 2,500 m³/s at 07:30 12 January 2011 to allow the peak of Lockyer Creek to enter the Brisbane River. After the downstream peak in the lower Brisbane River has passed, releases will be increased to maximum of 3,500 m³/s. This release will then be maintained to drain the flood storage component within the required 7 days.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2 million megalitres.

North Pine

At 15:00 North Pine Dam was 39.74 mAHD falling with all gates open 1 increment, releasing about 80 m³/s. North Pine peaked at 41.11 mAHD at 14:00 on 11 January 1974 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML. It is expected that gates will be closed on Thursday or Thursday.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels through the Brisbane and Pine catchments and reviewing operating strategy every 30 minutes. The FOC is maintaining close contact with warning agencies and local councils.

The next report will be issued at 18:00 12 January 2011.

Rainfall

Rainfall in the last 12 hours is generally below 5mm with a couple of 10mm falls in the Stanley and North Pine catchments. There is no significant rain expected in the next 4 days.

Somerset/Wivenhoe

Somerset Dam has peaked at 105.11 mAHD at 06:00 on 12 January 2011. One sluice was opened at 1030 12 January 2011. Somerset Dam was 104.87 mAHD at 1700 12 January 2011 and discharging 1,410 m³/s. Sluice gates will be utilised to drain of the flood storage compartment during the next 5 days.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s. Wivenhoe Dam was 74.82 m AHD at 17:00 and steady.

The release from Wivenhoe Dam was reduced to 2,500 m³/s at 07:30 12 January 2011 to allow the peak of Lockyer Creek to enter the Brisbane River and this release has been maintained since. After the downstream peak in the lower Brisbane River has passed, releases will be increased to maximum of 3,500 m³/s. The release is expected to commence Thursday and then be maintained at this level to drain the flood storage component within the required 7 days. The releases will not result in any renewed rises at downstream locations.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be 2.6 million megalitres.

North Pine

At 17:00 North Pine Dam was 39.74 mAHD steady with all gates open 1 increment, releasing about 80 m³/s. North Pine peaked at 41.11 mAHD at 14:00 on 11 January 1974 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML. It is expected that gates will be closed on Thursday or Friday.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels through the Brisbane and Pine catchments and reviewing operating strategy regularly. The FOC is maintaining close contact with warning agencies and local councils.

Rainfall

Rainfall in the last 12 hours is generally below 5mm with isolated falls of up to 15mm in the Stanley, Lockyer and Pine River catchments. There is no significant rain expected for the next 4 days.

Somerset/Wivenhoe

Somerset Dam peaked at 105.11 mAHD at 06:00 on Wednesday 12 January 2011. The current level is 104.34 mAHD. One sluice was opened at 10:30 on 12 January 2011 and the dam is currently discharging 1,130 m³/s. Sluice gates will be utilised to drain of the flood storage compartment during the next 5 days.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on Tuesday 11 January 2011 with a corresponding discharge of 7,450 m³/s. Wivenhoe Dam was 74.72 m AHD at 06:00 and commence to fall slowly.

The releases from Wivenhoe Dam have been temporarily reduced to 2,500 m³/s at 07:30 on Wednesday 12 January 2011 to allow the peak of Lockyer Creek to enter the Brisbane River. The Brisbane River has peaked at the Port Office Gauge early Thursday morning. Releases from Wivenhoe Dam will be managed to achieve a target flow of around 3,500 m³/s at Moggill. This release will then be maintained to drain the flood storage component within the required 7 days.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

North Pine

At 06:00 North Pine Dam was 39.70 mAHD falling with all gates open 1 increment, releasing about 80 m³/s. North Pine peaked at 41.11 mAHD at 14:00 on Tuesday 11 January 2011 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML. It is expected that all gates will be closed on Friday.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels throughout the Brisbane and Pine River catchments and reviewing operating strategy. The FOC will continue to maintain close contact with warning agencies and local councils.

Rainfall

There has been no significant rainfall in the last 12 hours and none is expected for the next 5 days.

Somerset/Wivenhoe

Somerset Dam peaked at 105.11 mAHD at 18:00 on Wednesday 12 January 2011. The current level is 103.60 mAHD and falling. Four sluices are open and the dam is currently discharging 1,528 m³/s.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on Tuesday 11 January 2011 with a corresponding discharge of 7,450 m³/s. Wivenhoe Dam was 74.5 mAHD at 18:00 and continuing to fall slowly.

The releases from Wivenhoe Dam are currently 2,888 m³/s and are being managed to achieve a target flow of around 3,500 m³/s at Moggill. This release will then be maintained to drain the flood storage component within the required 7 days.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

North Pine

At 18:00 North Pine Dam was 39.60 mAHD and falling with 5 gates open, releasing about 151 m³/s. North Pine peaked at 41.11 mAHD at 14:00 on Tuesday 11 January 2011 with a peak release of 2,800 m³/s. The flood event volume is estimated to be around 200,000 ML.

All gates will be closed at 05:00 Friday to enable MMRC to consider reopening Youngs Crossing.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels throughout the Brisbane and Pine River catchments and reviewing operating strategy. The FOC will continue to maintain close contact with warning agencies and local councils.

The next report will be issued at 06:00 on Friday 14 January 2011.

Subject: FOC Situation Report at 06:00 on Friday 14 January 2011

Rainfall

There has been no significant rainfall in the last 12 hours and falls of only 5mm is expected in the next twenty-four hours. Mostly fine conditions are expected over the weekend, but showers will return early next week.

Somerset/Wivenhoe

Somerset Dam peaked at 105.11 mAHD at 18:00 on Wednesday 12 January 2011. The current level is 102.87 mAHD and falling. Four sluices are open and the dam is currently discharging about 1,300 m³/s.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on Tuesday 11 January 2011 with a corresponding discharge of 7,450 m³/s. At 05:00 Wivenhoe Dam was 74.74.08 mAHD and continuing to fall.

The releases from Wivenhoe Dam are currently about 3,500 m³/s and are being managed to achieve a target flow of around 3,500 m³/s at Moggill. This release will then be maintained to drain the flood storage component by Wednesday.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

North Pine

At 05:00 North Pine Dam was 39.40 mAHD and gate operations have ceased. The current level is expected to increase to just over 39.5 mAHD in the next few days due to base-flow. This could be higher if further rainfall occurs.

Fish recovery has commenced and MBRC have been advised that the gates have been closed. MBRC will inspect Youngs Crossing to determine if the crossing can be re-opened.

North Pine peaked at 41.11 mAHD at 14:00 on Tuesday 11 January 2011 with a peak release of 2,800 m³/s. The flood event volume is estimated to be around 200,000 ML.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels throughout the Brisbane and Pine River catchments. The FOC will continue to maintain close contact with warning agencies and local councils.

Somerset/Wivenhoe

At 06:00 Somerset Dam was 100.01 mAHD and falling. Four sluices are open and the dam is currently discharging about 820 m³/s. Somerset Dam peaked at 105.11 mAHD at 18:00 on Wednesday 12 January 2011.

At 06:00 Wivenhoe Dam was 71.3 mAHD and continuing to fall. The releases from Wivenhoe Dam are currently about 3,477 m³/s and are being managed to achieve a target flow of around 3,500 m³/s at Moggill. This release level is being maintained to drain the flood storage component by Wednesday.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on Tuesday 11 January 2011 with a corresponding discharge of 7,450 m³/s.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

North Pine

At 06:00 North Pine Dam was 39.46 mAHD. All gates are closed. The lake level is expected to increase to just over 39.5 mAHD in the next few days due to base-flow. This could be higher if further rainfall occurs.

North Pine peaked at 41.11 mAHD at 14:00 on Tuesday 11 January 2011 with a peak release of 2,800 m³/s. The flood event volume is estimated to be around 200,000 ML.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels throughout the Brisbane and Pine River catchments and is maintaining close contact with warning agencies and local councils.

The next report will be issued at 18:00 on Sunday 16 January 2011.

Engineer 3
Duty Engineer
Flood Operations Centre

APPENDIX E – SITUATION REPORTS (continued)

Situation Report 29

Date: Monday 17 January 2011

Time: 16:56

From: Duty Engineer

Sent: Monday, 17 January 2011 4:56 PM

To: Distribution List

Subject: Situation Report 1700 Monday 16 January 2011

Rainfall

There has been no significant rainfall in the last 24 hours and no significant rainfall is expected in the next twenty-four hours. Mostly fine conditions are expected over the weekend, but showers will return early next week.

Somerset/Wivenhoe

At 16:00 Somerset Dam was 99.02 mAHD and steady. The last sluice gate was closed at 7:00 17/01/2011 and one regulator was opened the base-flow into the Dam. Somerset Dam peaked at 105.11 mAHD at 18:00 on Wednesday 12 January 2011.

At 16:00 Wivenhoe Dam was 68.66 mAHD and continuing to fall. The releases from Wivenhoe Dam are currently about 2946 m³/s. Releases will be steadily reduced before final closure on Thursday morning. The Dam will be near full supply and releases will be made through the regulator to account for ongoing base-flow.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on Tuesday 11 January 2011 with a corresponding discharge of 7,450 m³/s.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

It should be noted that the automatic recorder currently being reported on the BoM website is currently incorrect and has been since early Tuesday 11 2011.

North Pine

At 09:00 North Pine Dam was 39.5 mAHD. All gates are closed. No further gate operations are expected unless additional rainfall falls.

North Pine peaked at 41.11 mAHD at 14:00 on Tuesday 11 January 2011 with a peak release of 2,800 m³/s. The flood event volume is estimated to be around 200,000 ML.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels throughout the Brisbane and Pine River catchments and is maintaining close contact with warning agencies and local councils. Councils have been informed of the current release strategy. The bridges below Wivenhoe Dam will progressively come out of water over the next few days.

Subject: Situation Report 0615 Tuesday 18 January 2011

Rainfall

There has been no significant rainfall in the last 24 hours and no significant rainfall is expected in the next twenty-four hours. Mostly fine conditions are expected over the weekend, but showers will return early next week.

Somerset/Wivenhoe

At 16:00 Monday Somerset Dam was 99.02 mAHD and steady. The last sluice gate was closed at 07:00 17/01/2011 and one regulator remains open managing the base-flow into the Dam. Somerset Dam peaked at 105.11 mAHD at 18:00 on Wednesday 12 January 2011.

At 06:00 Tuesday Wivenhoe Dam was 67.82 mAHD and continuing to fall slowly. Releases were held constant overnight at about 2,050 m³/s to assist water supply pumping at Lowood. Following discussions with water supply operators, it has been decided to resume closing gates at 09:00 Tuesday before final closure on Thursday morning. The Dam will be near full supply and releases will be made through the regulator to account for ongoing base-flow.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on Tuesday 11 January 2011 with a corresponding discharge of 7,450 m³/s.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

It should be noted that the Seqwater water level gauge currently being reported on the BoM website is currently slightly under reading by about 50mm.

North Pine

At 09:00 North Pine Dam was 39.5 mAHD. All gates are closed. No further gate operations are expected unless additional rainfall falls.

North Pine peaked at 41.11 mAHD at 14:00 on Tuesday 11 January 2011 with a peak release of 2,800 m³/s. The flood event volume is estimated to be around 200,000 ML.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels throughout the Brisbane and Pine River catchments and is maintaining close contact with warning

APPENDIX E – SITUATION REPORTS (continued)

agencies and local councils. Councils have been informed of the current release strategy.

At 05:00, the Wivenhoe Dam operator reported that the Fernvale Bridge was out of water but water remained over the approaches from Fernvale. He also advised that there were power lines on the bridge and that Energex was advised.

The remaining bridges below Wivenhoe Dam will progressively come out of water over the next few days.

APPENDIX E – SITUATION REPORTS (continued)

Situation Report 31

Date: Tuesday 18 January 2011

Time: 17:40

From: Duty Engineer

Sent: Tuesday, 18 January 2011 5:40 PM

To: Distribution List

Cc: Distribution List

Subject: FOC Situation Report at 18:00 on Tuesday 18 January 2011

Rainfall

Severe thunderstorms are passing over Wivenhoe, Somerset and North Pine Dams this afternoon. To 17:00 falls of 20 to 30 mm were recorded at isolated locations including Mt Pechey and Klivers Lookout.

A severe thunderstorm warning remains in place for the Stanley River Valley near Kilcoy.

Somerset/Wivenhoe

At 16:00 Tuesday Somerset Dam was 98.95 mAHD and steady. The last sluice gate was closed at 07:00 17/01/2011 and one regulator remains open managing the base-flow into the Dam. Somerset Dam peaked at 105.11 mAHD at 18:00 on Wednesday 12 January 2011.

At 16:00 Tuesday Wivenhoe Dam was 67.31 mAHD and continuing to fall slowly.

Releases were held constant since 15:00 at about 1,450 m³/s to assist water supply pumping at Lowood. The shutdown sequence is scheduled to re-commence at 03:00 on Wednesday 19 January 2011 morning before final closure on Thursday morning. The Dam will be lowered to 66.5 mAHD (95% capacity) and releases will be made through the regulator to account for ongoing base-flow.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on Tuesday 11 January 2011 with a corresponding discharge of 7,450 m³/s.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

It should be noted that the Seqwater water level gauge currently being reported on the BoM website is currently slightly under reading by about 50mm.

North Pine

At 09:00 North Pine Dam was 39.56 mAHD and rising slowly. All gates are closed. No further gate operations are expected unless additional rainfall falls. This situation will be closely monitored whilst storms remain in the vicinity.

North Pine peaked at 41.11 mAHD at 14:00 on Tuesday 11 January 2011 with a peak release of 2,800 m³/s. The flood event volume is estimated to be around 200,000 ML.

APPENDIX E – SITUATION REPORTS (continued)

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels throughout the Brisbane and Pine River catchments and is maintaining close contact with warning agencies and local councils. Councils have been informed of the current release strategy.

The remaining bridges below Wivenhoe Dam will progressively come out of water over the next few days.

APPENDIX E – SITUATION REPORTS (continued)

Situation Report 32

Date: Wednesday 19 January 2011

Time: 05:28

From: Duty Engineer

Sent: Wednesday, 19 January 2011 5:28 AM

To: Distribution List

Cc: Distribution List)

Subject: FOC Situation Report at 06:00 on Wednesday 19 January 2011

Rainfall

Severe thunderstorms passed over the Wivenhoe, Somerset and North Pine dam catchments yesterday afternoon and evening. Falls of 20mm to 30mm were recorded at isolated locations.

North Pine

A decision was made at 1900 yesterday to drain the dam down to 39.40m AHD overnight to cater for the inflow resulting from yesterday's storms and ensure that Youngs Crossing remains open during the day today. All gates were closed at 0500 today and a fish recovery operation also commenced at this time. Youngs Crossing will be reopened by the MBRC at around 0700. The dam level will rise slowly during the day and further releases may be required again tonight with more rainfall forecast. The current lake level is 39.42m AHD.

Somerset Dam

All regulators were closed at 2000 yesterday. The dam level is currently 98.95m AHD and rising slowly. Further regulator releases will take place today and again over the next few days to maintain the dam at the full supply level. Somerset Dam peaked at 105.11 mAHD at 18:00 on Wednesday 12 January 2011; all sluice gates were closed on Monday 17 January 2011.

Wivenhoe Dam

The Lowood temporary pump station was relocated at 2100 yesterday. This relocation removed the need to continue high flow releases from the dam to ensure treated water supplies to Lowood are maintained. Discussions with BCC last night also concluded that tidal variations are primarily back to normal patterns and having a greater impact on the foundation conditions of Coronation Drive than the tapering of releases from the dam. Accordingly the radial gate close down sequence recommenced at 21:45 last night and all gates will be closed by 1600 today. The dam level when the last gate is closed will be around 66.90m AHD and a fish recovery operation will continue through most of the day during the close down sequence. Releases will continue through the regulator cone valve and possibly the Mini-Hydro (depending on when it can be re-started) to account for ongoing base-flow once all radial gates are closed.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on Tuesday 11 January 2011 with a corresponding discharge of 7,450 m³/s. The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres. It should be

APPENDIX E – SITUATION REPORTS (continued)

noted that the Seqwater water level gauge currently being reported on the BoM website is currently slightly under reading by about 50mm.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels throughout the Brisbane and Pine River catchments and is maintaining close contact with warning agencies and local councils. Councils have been informed of the current release strategy. A summary of the bridge status along the Brisbane River between Wivenhoe Dam and Moggill is as follows, with the exact timing of water coming clear of bridges depending on how the radial gate close down sequence progresses during the day:

- Water is clear of Fernvale Bridge and Mt Crosby Weir Bridge.
- Water should be clear of Burtons Bridge, Kholo Bridge and Savages Crossing tonight.
- Water should be clear of Colleges Crossing tomorrow.
- It is not yet certain when water will be clear of Twin Bridges as this will depend on base flow draining requirements and a decision will be made on this later today. The earliest that Twin Bridges would be clear of water is late this afternoon.

APPENDIX E – SITUATION REPORTS (continued)

Situation Report 33

Date: Wednesday 19 January 2011

Time: 13:45

From: Duty Engineer

Sent: Wednesday, 19 January 2011 1:45 PM

To: Distribution List

Subject: Situation Report 1345 Wednesday 2011

Rainfall

No significant rainfall has been recorded in Wivenhoe, Somerset and North Pine dam catchments since 0900 Thursday. The forecast rainfall indicates that falls between 15 to 25mm with isolated heavier falls to 50mm are expected in the next 24 hours.

North Pine

A decision was made at 1900 Wednesday to drain the dam down to 39.40m AHD overnight to cater for the inflow resulting from Wednesday's storms and ensure that Youngs Crossing remains open during the day Thursday. All gates were closed at 0500 Thursday and a fish recovery operation also commenced at this time. Youngs Crossing was expected to be reopened by the MBRC at around 0700. The dam level will rise slowly during the day and further releases may be required again tonight with more rainfall forecast. The lake level was 39.43m AHD at 0700.

Somerset Dam

All regulators were closed at 2000 Wednesday. The dam level was 99.00 m AHD at 0700 Thursday and rising slowly. Further regulator releases may take place over the next few days to maintain the dam at the full supply level. Somerset Dam peaked at 105.11 mAHD at 18:00 on Wednesday 12 January 2011; all sluice gates were closed on Monday 17 January 2011.

Wivenhoe Dam

All gates were closed at Wivenhoe at 1200 Thursday, with the dam level at 66.89m AHD at 1300. Following fish recovery and inspections, minor ongoing releases will be made for through the centre gate to account for ongoing small inflows. It is intended to drain down to 95%, approximately 66.5 m AHD.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on Tuesday 11 January 2011 with a corresponding discharge of 7,450 m³/s. The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

Strategy

A summary of the bridge status along the Brisbane River between Wivenhoe Dam and Moggill is as follows, with the exact timing of water coming clear of bridges depending on how the radial gate close down sequence progresses during the day:

- Water is clear of Fernvale Bridge and Mt Crosby Weir Bridge.

APPENDIX E – SITUATION REPORTS (continued)

- Water should be clear of Burtons Bridge, Kholo Bridge and Savages Crossing tonight.
- Water should be clear of Colleges Crossing tomorrow.
- It is not yet certain when water will be clear of Twin Bridges as this will depend on base flow draining requirements and a decision will be made on this later Thursday.

The Flood Operations Centre is now closed and control of the dams has reverted to normal Seqwater operations. However, the FOC will continue to monitor rainfalls and water levels throughout the Brisbane and Pine River catchments.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS

Technical Situation Report 1

Date: Monday 27 December 2010

Time: 08:14

The Flood Centre will keep you informed or leave messages on your phones.

Below is the current strategy.
Any comments or assessments let me know.

Rainfall

Reasonably significant rainfalls in the order of 40 to 50 mm have been experienced in the dam catchments in the last 24 hours, but the rainfall has only been in the order of 5 to 10mm in the last 6 hours. The QPF issued at 1600 yesterday was for 50 to 100mm and the severe weather warning associated with possible widespread rainfall in the dam catchments remains current and was re-issued by BOM at 0445 today. The current BOM forecast is:

Monday 27 December Rain periods
Tuesday 28 December Rain at times
Wednesday 29 December Rain at times
Thursday 30 December Shower or two
Friday 31 December Fine
Saturday 31 December Fine
Sunday 1 January Fine

With the current wet catchments, there is a high probability that the forecast rain will result in further flood releases from the dams over the coming week.

Somerset Dam

Two regulators were opened yesterday morning, to provide a release of 12000ML/day. Since that time the lake has continued to rise steadily to currently be around 99.60m or 600mm above the full supply level. Another regulator was opened this morning. Further gate operations may be necessary today if forecast rainfall results in subsequent river rises. Draining will take at least until Wednesday. The next update will be provided at around 1200 today.

Currently at 107.7% with 30,000ML over FSL.

Wivenhoe Dam

Radial Gate operations recommenced yesterday at 0900 and since that time the lake has risen steadily to currently be around 67.57m or 570mm above the full supply level. Because of outflows from Lockyer Creek, outflows from Wivenhoe Dam have been steadily reduced during the night to ensure Burtons Bridge remained open (current river levels have water at Burtons Bridge deck level and falling slowly). Radial gates at Wivenhoe Dam are being progressively wound back this morning as the Lockyer Creek outflows into the Brisbane River increase above 250 cumecs. This will keep Burtons Bridge open until late this afternoon. However it is anticipated that Lockyer Creek

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

outflows will peak above 500 cumecs later today or early tomorrow and these flows will inundate Burtons Bridge. As this occurs, outflows from Wivenhoe Dam will be increased to drain the lake to near full supply level. Draining will take at least until Thursday. Further gate operations may be necessary in coming days if forecast rainfall results in subsequent river rises.

Wivenhoe is around 105.6% and 65,000ML over FSL.

Impacts of Wivenhoe Dam Releases

Twin Bridges, Savages Crossing and Colleges Crossing are currently closed and will remain so until at least Thursday. Burtons Bridge is currently open, but will be closed late today or early tomorrow and is likely to remain closed until at least Wednesday. However, the length of time that Burtons Bridge will be closed is dependant upon the rainfall experienced over the next several days. Kholo Bridge remains unserviceable due to flood damage. There is no current expectation that either Mt Crosby Weir Bridge or Fernvale Bridge will be impacted by the current event.

An updated estimate of the time of closure of Burtons Bridge this afternoon will be provided to Council, but at this stage it is not expected to be before 1600 today. This may change as rainfall is experienced during the day.

Tide levels in Brisbane are decreasing generally so Wivenhoe releases should have minimal impact.

Dam Operations Manager
Water Delivery
Queensland Bulk Water Supply Authority *trading as Seqwater*

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Technical Situation Report 2

Date: Tuesday 28 December 2010

Time: 07:12

The Flood Centre will keep you informed or leave messages on your phones.

Below is the current strategy.
Any comments or assessments let me know.

Basically with all the rain in the Lockyer we have not ramped up until it peaks and starts to drop to ensure there is no impact on Fernvale or Mt Crosby bridges.
This should still be later today as the Lockyer starts to drop.

Rainfall

Rainfalls in the order of 20 to 40 mm have been experienced in the dam catchments in the last 24 hours, but the rainfall has only been in the order of 5 mm in the last 12 hours. The QPF issued at 1600 yesterday was reduced to 25 to 35mm and the severe weather warning associated with possible widespread rainfall in the dam catchments is no longer current. The current BOM forecast is:

Tuesday 28 December Shower or two.

Wednesday 29 December Shower or two.

Thursday 30 December Fine.

Friday 31 December Fine

Saturday 31 December Mostly Fine

Sunday 1 January Few showers

Monday 27 December Showers

Although the dam catchments are saturated, BOM forecasts are currently indicating that dam inflows have peaked for the current event.

North Pine Dam – Just FYI

A flood release commenced at 2000 on Sunday 26 December 2010 and is now likely to continue until 0500 on Wednesday 29 December 2010 (tomorrow morning). This will allow Youngs Crossing to reopen by 0700 on Wednesday. Current outflows from Lake Kurwongbah would also be sufficient to inundate Youngs Crossing, regardless of releases from North Pine Dam, but these outflows should also subside by Wednesday morning.

The current level in North Pine Dam is around 39.72 m AHD and falling, with all gates currently open. The situation will be reviewed throughout today, with the next update to be provided at around 1600 today.

Somerset Dam

A flood release through the regulator cone valves at the dam commenced at 0900 on Sunday 26 December 2010. The current release rate is 18000ML/day. Since commencing the release the lake has continued to rise steadily to currently be around 99.96m AHD or 960mm above the full supply level. Inflows into the dam are subsiding and unless further rainfall in the dam catchment is experienced, the lake will soon start to

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

fall slowly to be back near the dam full supply level by Thursday. Sluice gate operations will commence this morning as Wivenhoe levels are approaching the point at which the regulator cone valves should not be used due to back water impacts. The total volume of water released since the release commenced on 26 December 2010 is 37,000ML, with the current projected total release volume for this event being 80,000ML.

Wivenhoe Dam

Radial Gate operations for the current event commenced at 0900 on Sunday 26 December 2010. After scaling up to an initial release rate of 30,000ML/day, the release was scaled back yesterday to the minimum radial gate release rate of 4,000ML/day to ensure that Burtons Bridge remained open until yesterday afternoon and to reduce flooding impacts in the Brisbane River caused by outflows into the river from Lockyer Creek. The current release rate remains at 4,000ML/day, but will be scaled up later today as Lockyer Creek flows subside. The current lake level is 68.55m AHD or 1550mm above the full supply level. Inflows into the dam are subsiding and unless further rainfall in the dam catchment is experienced, the lake will fall slowly once to release rate is scaled up, for the level to be back near the dam full supply level by around Sunday. The total volume of water released since the release commenced on 26 December 2010 is 28,000ML, with the current projected total release volume for this event being in the order of 375,000ML (includes inflows from Somerset Dam).

Impacts of Wivenhoe Dam Releases

Twin Bridges, Savages Crossing, Colleges Crossing, Burtons Bridge and Kholo Bridge are currently closed and will remain so until at least Friday. There is no current expectation that either Mt Crosby Weir Bridge or Fernvale Bridge will be impacted by the current event, but Lockyer Creek outflows are being closely monitored and will come close to impacting upon the Mt Crosby Weir Bridge. An updated estimate of the likely time of opening of Burtons Bridge will be provided tomorrow.

Tide levels in Brisbane are decreasing generally so Wivenhoe releases should have minimal impact. BoM advice confirms this. Impacts from Bremer and other inflows should have mostly passed by the time any release from Wivenhoe gets to downstream river reaches.

Dam Operations Manager
Water Delivery
Queensland Bulk Water Supply Authority *trading as Seqwater*

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Technical Situation Report 3

Date: Wednesday 29 December 2010

Time: 07:16

The Flood Centre will keep you informed or leave messages on your phones.

Below is the current strategy.
Any comments or assessments let me know.

Rainfall

No rainfall has fallen in the past 12 hours to 0600 Wednesday with the exception of 2-4 mm in the upper Somerset Dam catchment.
The rainfall forecast issued by BOM at 1600 Tuesday indicated only 3-5 mm in the Somerset and Wivenhoe catchments and 5-10mm in the North Pine catchment for the next 24 hours. The current BOM forecast for SE Qld over the next few days is mostly fine with a few showers

However, catchments remain saturated and are primed for additional runoff in the event of rain.

Somerset Dam

A flood release through the regulator cone valves at the dam commenced at 0900 on Sunday 26 December 2010. Early Tuesday the regulators were closed and sluices progressively opened throughout the day. At 1800 Tuesday 2 sluices were open, releasing about 35,000 ML/day into Wivenhoe. A further two sluice gates were opened overnight in an attempt to bring the lake level down to 99.75 to enable recreational use of Somerset water activities to resume on Wednesday. At 1800, the lake level was 99.83m AHD and falling slowly. Two sluice gates will be closed by 12:00 29/12/2010 and two sluice gates are expected to remain open until Thursday and will be closed when the lake returns to the full supply level of 99m AHD. The total volume of water released since the event commenced on 26 December 2010 is 66,000ML, with the current projected total release volume for this event approaching 110,000ML.

Wivenhoe Dam

Radial gate operations for the current event commenced at 0900 on Sunday 26 December 2010. After scaling up to an initial release rate of 30,000ML/day, the release was scaled back Monday to the minimum radial gate release rate of 4,000ML/day to ensure that Burtons Bridge remained open and to reduce flooding impacts in the Brisbane River caused by flows from Lockyer Creek. Lockyer Ck outflow peaked at midday Tuesday and Wivenhoe gates were commenced to be re-opened at 1500 Tuesday, releasing on the back of the Lockyer recession. It is intended to gradually increase the Wivenhoe releases during Tuesday and Wednesday so that the combined release and Lockyer flow is maintained at about 1600m³/s (140,000 ML/day) in the mid Brisbane R. Note this is similar to the flows in the mid Brisbane in mid October and mid December 2010. This will be maintained until at least Saturday when it is expected that shut down procedure will commence. Gate closure sequencing will be such that the releases will mimic the natural pre-dam flows.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

At 0600, the Wivenhoe water level was 69.26m AHD and rising slowly with the current release rate at 60,000ML/day. Inflows into the dam are subsiding and the lake will fall slowly once the release rate is scaled up 130,000 ML/day during Wednesday. It is aimed to return the dam to full supply level by Sunday. The total volume of water released since the event commenced on 26 December 2010 is 56,000ML, with the current projected total release volume for this event being in the order of 385,000ML (includes inflows from Somerset Dam).

Impacts of Wivenhoe Dam Releases

Twin Bridges, Savages Crossing, Colleges Crossing, Burtons Bridge and Kholo Bridge are currently closed and will remain so until at least Sunday. There is no current expectation that either Mt Crosby Weir Bridge or Fernvale Bridge will be impacted by the current event. At this stage, it is estimated that the flow at Burtons Bridge will fall below the bridge deck on Sunday morning.

Tide levels in Brisbane are decreasing generally so Wivenhoe releases should have minimal impact. BoM advice confirms this. Impacts from Bremer and other inflows should have mostly passed by the time any release from Wivenhoe gets to downstream river reaches.

Dam Operations Manager
Water Delivery
Queensland Bulk Water Supply Authority *trading as Seqwater*

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Technical Situation Report 4

Date: Thursday 30 December 2010

Time: 07:03

The Flood Centre will keep you informed or leave messages on your phones.

Below is the current strategy.
Any comments or assessments let me know.

Rainfall

There has been no significant rainfall in the North Pine, Somerset and Wivenhoe catchments since 09:00 on Wednesday 29 December 2010. The current BOM forecast for SE Qld over the next few days is mostly fine with a few light showers, although there is a chance of storms on Tuesday and Wednesday next week.

The catchments remain saturated and are primed for additional runoff in the event of rain.

Somerset Dam

At 06:00 Thursday 30 December 2010, two sluices remain open, releasing about 35,000 ML/d into Lake Wivenhoe and are expected to remain open until Thursday afternoon when the lake returns to the full supply level of 99.00m AHD. The total volume of water released since the event commenced on 26 December 2010 is 104,000ML, with the current projected total release volume for this event approaching 123,000ML.

Wivenhoe Dam

Releases were gradually increased during Wednesday and Thursday morning until the combined release and Lockyer flow reached about 1,600m³/s (140,000 ML/d) in the middle Brisbane River. (Note this is similar to the flows in the releases made in mid-October and earlier in December 2010). This release will be maintained until mid-day Friday 31 December 2010, when the shut down procedure will commence and gates are expected to be fully closed by Sunday morning 2 January 2010. The proposed gate closure sequence will be such that the releases will mimic the natural pre-dam recessional flows.

Gauge board readings indicate that the Wivenhoe dam water level peaked at 69.33m at noon Wednesday 29 December 2010, about 2.3m above the full supply level. At this level, the dam was temporarily storing over 270,000ML of flood water. At 06:00 on Thursday 30 December 2010, the level had fallen slightly to 69.07m AHD and was releasing about 1,530m³/s (132,000ML/d). The total volume of water released from Wivenhoe dam since the event commenced on 26 December 2010 is 160,000ML, with the current projected total release volume for this event being in the order of 425,000ML (includes inflows from Somerset Dam).

Impacts of Wivenhoe Dam Releases

Twin Bridges, Savages Crossing, Colleges Crossing, Burtons Bridge and Kholo Bridge are currently closed due to inundation and will remain so until at least Sunday 2 January

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

2011. There is no current expectation that either Mt Crosby Weir Bridge or Fernvale Bridge will be impacted by this event. At this stage, it is estimated that the flow at Burtons Bridge will fall below the bridge deck on Sunday morning.

Wivenhoe releases should have minimal impact on tides based on planned releases. BoM advice confirmed this earlier in the week. Impacts from Bremer and other inflows should have mostly passed by the time any release from Wivenhoe gets to downstream river reaches.

Water Delivery
Queensland Bulk Water Supply Authority *trading as Seqwater*

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Technical Situation Report 5

Date: Friday 31 December 2010

Time: 06:51

The Flood Centre will keep you informed or leave messages on your phones of any issues or major changes.

Below is the current strategy.
Any comments or assessments let me know.

Rainfall

There has been no significant rainfall in the North Pine, Somerset and Wivenhoe catchments since 0900 on Wednesday 29 December 2010. The current BOM forecast for SE Qld over the next few days is mostly fine with a few light showers, although there is a chance of storms on Tuesday and Wednesday next week.

The catchments remain wet and are likely to generate additional runoff in the event of rain.

Somerset Dam

At 0500 on Friday 31 December 2010, the lake level was 99.01m AHD falling from a peak of 100.0m AHD reached around noon Tuesday 28 December 2010. Two regulators are currently operating and will remain open until the lake returns to the full supply level of 99.00m AHD. The total volume of water released since the event commenced on 26 December 2010 is 126,000 ML, with the current projected total release volume for this event approaching 130,000ML.

Wivenhoe Dam

Releases were gradually increased during Wednesday and Thursday morning until the combined release and Lockyer flow reached about 1,600m³/s (140,000 ML/d) in the middle Brisbane River. (Note this is similar to the flows in the releases made in mid-October and earlier in December 2010). Flow measurement carried out by the Department of Environment and Heritage during Thursday has confirmed this flow. This release will be maintained until late Friday 31 December 2010, when the shut down procedure will commence and gates are expected to be fully closed by Sunday 2 January 2010. The proposed gate closure sequence will be such that the releases will mimic the natural pre-dam recessional flows.

Gauge board readings indicate that the Wivenhoe dam water level peaked at 69.33m at noon Wednesday 29 December 2010, about 2.3m above the full supply level. At this level, the dam was temporarily storing over 270,000ML of flood water. At 0500 on Friday 31 December 2010, the level had fallen slightly to 68.40m AHD and was releasing about 1,550m³/s (132,000ML/d). The total volume of water released from Wivenhoe dam since the event commenced on 26 December 2010 is 293,000ML, with the current projected total release volume for this event being in the order of 450,000ML (includes inflows from Somerset Dam).

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Impacts of Wivenhoe Dam Releases

Twin Bridges, Savages Crossing, Colleges Crossing, Burtons Bridge and Kholo Bridge are currently closed due to inundation and will remain so until at least Sunday 2 January 2011. There is no current expectation that either Mt Crosby Weir Bridge or Fernvale Bridge will be impacted by this event. At this stage, it is estimated that the flow at Burtons Bridge will fall below the bridge deck on Sunday morning.

Wivenhoe releases should have minimal impact on tides based on planned releases. BoM advice confirmed this earlier in the week. Impacts from Bremer and other inflows should have mostly passed by the time any release from Wivenhoe gets to downstream river reaches.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Technical Situation Report 6

Date: Sunday 2 January 2011

Time: 09:37

This is the last update.
Let me know of any issues.

Many thanks for everyone's support.

Rainfall

There has been light falls of up to 30mm in the North Pine and Somerset Dam catchments in the 24 hours to 06:00 Sunday 2 January 2011 which has resulted in some runoff in the Stanley and Pine Rivers. The current BOM forecast for SE Qld over the next week is for light showers, although there is a chance of storms on Wednesday and Thursday next week.

The catchments remain wet and are likely to generate additional runoff in the event of rain.

Somerset Dam

The rain in the Stanley River catchment has produced minor inflows and one regulator is partially open, managing the small inflows.

At 07:30 on Sunday 2 January 2010, the lake level was EL 99.10m AHD and rising slowly. The peak of the event occurred around noon on Tuesday 28 December 2010 with a level of EL 100.0 m. The total volume of water released since the event commenced on 26 December 2010 is 135,000 ML.

Wivenhoe Dam

At 09:00 on Sunday 2 January 2011, Wivenhoe Dam level was EL 67.10 m and gates are fully closed and fish recovery has commenced. Upon completion of this operation, a regulator will be fully opened to manage continuing low inflows to the dam.

The total volume of water released from Wivenhoe dam since the event commenced on 26 December 2010 is 480,000ML (includes inflows from Somerset Dam).

Impacts of Wivenhoe Dam Releases

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the closure.

It is expected that the flow in the mid Brisbane R will fall below Burtons Bridge on Sunday morning and below Colleges Crossing by Monday morning. Twin Bridge will continue to be impact by the continuing low releases for several days.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Technical Situation Report 7

Date: Thursday 6 January 2011

Time: 12:16

The Flood Centre will keep you informed or leave messages on your phones.

Below is the current strategy.
Any comments or assessments let me know.

Rainfall

Since 9am Wednesday, there have been widespread falls of 30mm with isolated heavy falls up to 50mm in the Somerset and Wivenhoe catchments. Totals in the North Pine catchment have generally been below 10mm. Falls up to 60mm were recorded in the Leslie Harrison catchment.

The forecast for the next 24 to 48 hours is for totals up to 150mm in SE Qld.

The catchments remain wet and are likely to generate additional runoff in the event of rain.

North Pine Dam

At 0700 Thursday, North Pine Dam was 39.60m, 0.05m below gate trigger level and having risen 0.18m since 2/1/2011 due to a combination of baseflow and runoff from rain in the last 24 hours.

Given the forecast rain, gate operations will commence tonight. MBRC will be advised this morning

Somerset Dam

At 0700 Thursday, Somerset Dam was 99.34m, 0.34m above FSL, and rising slowly. The rain in the Stanley River catchment has produced a small amount of runoff in the upper Stanley but there have been significant rises in Kilcoy Ck. Further regulator operations will be required later Thursday.

Wivenhoe Dam

At 0700 Thursday, Wivenhoe Dam was 67.31m and rising slowly. This is 0.31m above FSL and above the gate trigger level of 67.25m. There have been rises recorded at rivers and stream upstream of Wivenhoe Dam. Gates will be opened in the next 24 hours to manage the inflows from the upper Brisbane River and the outflow from Somerset.

Impacts of Wivenhoe Dam Releases

Based upon rain to date, expecting about 70,000ML from upper Brisbane. Lockyer Ck peak of about 100m³/s Friday afternoon. This will take out Twin Bridges and nearly inundate Savages Crossing. Colleges Crossing could be taken out by a combined Lockyer and local runoff.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Current strategy is to keep Burton Bridge free. On this basis, we will commence opening Wivenhoe at 1800 Thursday and ramp up to about 300m³/s by 2200. This would limit mid Brisbane flows to just under 400m³/s (Burtons capacity 450m³/s).

If rainfall increases and Lockyer and local runoff also increase, we can close/reduce Wivenhoe accordingly to ensure that that 450m³/s is not exceeded unless necessary.

Councils have been advised of this strategy and are contacting residents

Dam Operations Manager
Water Delivery
Queensland Bulk Water Supply Authority *trading as Seqwater*

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Technical Situation Report 8

Date: Saturday 8 January 2011

Time: 07:51

The Flood Centre will keep you informed or leave messages on your phones. Give them a call if you need further information.

Below is the current strategy.
Any comments or assessments let me know.

Rainfall

Since 0900 Friday, there has been widespread 20 to 40mm throughout North Pine, Somerset and Wivenhoe catchments with isolated higher totals of 70mm in the upper reaches of the Brisbane R. No significant rain has fallen in the past 12 hours.

Advice from BoM indicates that SE Qld can expect further high rainfall totals over the next 4 days.

Saturday: Rain light at times 5-50mm with higher falls along the coast
Sunday: Widespread rain with totals between 50-100mm
Monday: Widespread rain again with totals between 50-100mm
Tuesday: Rain easing with totals between 25-50mm

Given the saturated conditions of the catchments, significant inflows to Seqwater dams will be generated, especially following the forecast rainfall on Sunday/Monday.

North Pine (Full Supply Level 39.60 m AHD)

At 0600 Saturday, North Pine Lake Level was 39.46 m AHD and slowly rising. Currently 3 gates are open to release runoff from rain on Wed/Thursday/Friday. Given the very high likelihood of significant runoff during the next 4 days, gates will be kept open to match inflows over the next few days, rather than opening and closing at various times with short notice. Youngs Crossing will remain adversely impacted for the duration of the gates being open. Moreton Bay Regional Council has been advised and concurs with this strategy.

Somerset (Full Supply Level 99.00 m AHD)

At 0500 Saturday, Somerset Dam level was 100.42m AHD and rising. The Dam is releasing into Wivenhoe through one open sluice gate. Water will be temporarily held in Somerset to allow the inflow from the upper Brisbane to be passed through the system. However, this strategy may need to be reviewed if significant runoff occurs in the Stanley and Upper Brisbane. Under circumstances of high inflows to Somerset and Wivenhoe, it is the usual practice to hold flood water in Somerset until there is a high level of confidence in the estimated inflows to Wivenhoe.

Since the commencement of the event on 02/01/2011, approximately 85,000ML has flowed into Somerset Dam with a further 20,000ML expected based on the recorded rainfall to date. Approximately 25,000ML has been released into Wivenhoe.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Wivenhoe (Full Supply Level 67.00 m AHD)

At 0600 Saturday, Wivenhoe Dam was 68.45 m AHD and rising steadily with all five gates open and releasing about 890 m³/s. River levels upstream of Wivenhoe Dam were rising again, generating further inflow to the dam. It is intended to ramp up the release from Wivenhoe to 1,200m³/s by midday Saturday 08/01/2011. Further assessments will be undertaken to determine increases above this level. However, given the high likelihood of significant inflows in the next week, this may be increased.

Since the commencement of the event on 02/01/2011, approximately 200,000ML has flowed into Wivenhoe Dam (including Somerset releases) with a further 180,000ML expected based on the recorded rainfall to date. Approximately 50,000ML has been released from Wivenhoe via the hydro and regulator at about 50m³/s.

Impacts downstream of Wivenhoe

The projected Wivenhoe release of 1,200m³/s combined with Lockyer flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Savages Crossing, Burtons Bridge, Kholo Bridge and Colleges Crossing) will be adversely impacted for several days. At this stage Fernvale and Mt Crosby Weir Bridge are not expected to be affected but they could potentially be affected if the predicted rainfall totals eventuate.

The current available assessments indicate that the combined flow in the lower Brisbane R would only add 50mm to an upper limit of 100mm to the recorded water levels in the City Reach of the Brisbane River. However, it is noted that tides in the lower Brisbane R will be 0.4 to 0.5 metres higher than predicted tides.

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the Wivenhoe operating strategy.

Queensland Bulk Water Supply Authority *trading as Seqwater*

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Technical Situation Report 9

Date: Sunday 9 January 2011

Time: 07:32

The Flood Centre will keep you informed or leave messages on your phones. Give them a call if you need further information.

Below is the current strategy.
Any comments or assessments let me know.

Rainfall

Catchment average rainfall for the past 12 hours is; North Pine Dam (less than 10 mm); Somerset Dam (40 mm); Wivenhoe Dam (less than 10 mm). The bulk of the rain that has fallen in the Somerset Dam catchment has occurred in the last two hours, with recorded falls exceeding 60mm in some areas. The BOM forecast for the next seven days issued at 0450 this morning is:-

Sunday:	Rain periods.
Monday:	Rain periods.
Tuesday:	Rain periods.
Wednesday	A few showers.
Thursday	A shower or two.
Friday	A shower or two.
Saturday	Mostly fine.

A severe weather warning remains current for heavy rainfall in the dam catchment areas. The dam catchments are relatively saturated and significant inflows will be generated if the forecast rainfall eventuates.

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level is currently 39.47 m AHD and steady. Two radial gates remain open to release runoff generated from recent rainfall. Based on rainfall forecasts, the radial gates have been kept open in anticipation of further inflows over the next few days. However unless significant rain falls today, consideration will be given to closing the gates late this afternoon or early tomorrow morning and discussions to finalise a decision on the timing of radial gate closure will be held with the Moreton Bay Regional Council later today. Youngs crossing will remain closed while releases are in progress.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is currently falling slowly, with the current level being 100.27m AHD. However the rain that has fallen in the dam catchment over the last two hours (recorded falls exceed 60mm in some areas) will result in significant inflows later today. The current release rate into Wivenhoe Dam is 35,000ML/day. Since the commencement of the event on 02/01/2011 approximately 56,000ML has been released from the dam, with a total of at least 150,000ML to be released based on the currently recorded rainfall. The total release for the event is likely to increase significantly over the next few days based on the current rainfall forecasts. At this stage, releases will continue until at least Tuesday.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

The dam level is currently falling slowly, with the current level being 68.58m AHD. River levels upstream of the dam are receding, however further inflows will result from any additional rainfall. The current gate operation strategy will maintain flows of around 1,600m³/s in the mid-Brisbane River. The current release rate from Wivenhoe Dam is 116,000ML/day. Since the commencement of the event on 02/01/2011 approximately 150,000ML has been released from the dam, with a total of at least 450,000ML to be released based on the currently recorded rainfall. The total release for the event is likely to increase over the next few days based on the current rainfall forecasts. At this stage, releases will continue until at least Wednesday.

Impacts downstream of Wivenhoe Dam

The current Wivenhoe Dam release combined with Lockyer flows and local runoff will mean that all low level crossings downstream of Wivenhoe (Twin Bridges, Savages Crossing, Burtons Bridge, Kholo Bridge and Colleges Crossing) will be adversely impacted until at least Wednesday 12 January. At this stage Fernvale and Mt Crosby Weir Bridge are not expected to be affected, but this may be revised if the predicted rainfall totals eventuate and higher releases from Wivenhoe Dam are considered necessary.

Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the Wivenhoe operating strategy.

The current available assessments indicate that the combined flow in the lower Brisbane R would only add 50mm to an upper limit of 100mm to the recorded water levels in the City Reach of the Brisbane River. However, it is noted that tides in the lower Brisbane R will be 0.4 to 0.5 metres higher than predicted tides

Dam Operations Manager
Water Delivery
Queensland Bulk Water Supply Authority *trading as Seqwater*

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Technical Situation Report 10

Date: Monday 10 January 2011

Time: 06:23

The Flood Centre has kept you informed (and discussed with the BCC Flood Centre) of where we are at but below is a summary as at 1am this morning.

I will send off another Technical Report this morning so if you have any assessments or actions you are undertaking that you want included send them in.

Rainfall

Very heavy rainfall has been recorded in the Upper Brisbane and Stanley Rivers in the last 12 hours with totals up 100 to 240mm. Totals for the last 24 hours range from 100 to 300mm.

Rainfall of similar magnitudes is expected in the 12 to 24 hours around the downstream catchments as the system tracks south.

A severe weather warning remains current for heavy rainfall in the dam catchment areas.

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level was 39.95 m and steady. Five gates are open releasing 445 m³/s. The inflow into the dam since the commencement of the event is 42,000 ML. Estimated event volume is 57,000 ML assuming no further rainfall. Gate operations will continue until at least Tuesday 11 January 2011.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 102.22 m AHD and rising quickly (storing 157,000 ML above FSL). Peak inflow to the dam is estimated to be about 4,200 m³/s based on observed rainfall and could be as high as 5,000m³/s with additional forecast rainfall. Five sluice gates are open releasing about 1,100m³/s (95,000ML/d) into Wivenhoe Dam. At this stage the dam will reach at least 103.5 on Monday afternoon which will adversely impact areas around Kilcoy.

Since the commencement of the event on 02/01/2011 approximately 115,000ML has been released from the dam into Wivenhoe, with an event total of the order of 520,000ML expected. This is expected to increase due to the forecast rain in the next 24 to 48 hours. At this stage, releases will continue until at least Thursday.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

River levels upstream of the dam are rising quickly with significant inflow being generated from the intense heavy rainfall. Flows in the Brisbane River at Gregor's Ck have already reached 7,350m³/s and the river has just peaked at 23:00 on Sunday 9 January.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

The dam level is rising quickly, with the current level being 69.60m AHD (storing 301,000 ML). Estimated peak inflow to the dam just from the Upper Brisbane R alone may reach as high as 8,800m³/s and, at this stage, the dam will reach at least 73.3 m AHD during Tuesday morning. Given the rapid increase in inflow volumes, it will be necessary to increase the release from Wivenhoe during Monday morning.

The objective for dam operations will be to minimise the impact of urban flooding in areas downstream of the dam and, at this stage, releases will be kept below 3,500m³/s and the combined flows in the lower Brisbane will be limited to 4,000m³/s if possible.

Fernvale Bridge approaches and Mt Crosby Weir Bridge have been inundated and both bridges are now closed or are in the process of being closed.

The current release rate from Wivenhoe Dam is 1,400m³/s (120,000ML/day). Gate opening will start to be increased during early Monday morning and the release is expected to increase to at least 2,600m³/s.

Since the commencement of the event on 02/01/2011 approximately 240,000ML has been released from the dam, with an event total approaching 1,500,000ML without further rain and as much as 2,100,000ML with forecast rainfall of (both including Somerset outflow). At this stage, releases will continue until at least Sunday 16th January 2011.

Impacts downstream of Wivenhoe Dam

The projected Wivenhoe Dam releases combined with Lockyer flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Saturday 15 January in varying degrees.

Water levels in the lower Brisbane R will be impacted by the combined flows of Lockyer Ck, Bremer River, local runoff and releases from Wivenhoe Dam. Somerset Regional, Ipswich City and Brisbane City Councils have been advised of the Wivenhoe operating strategy.

Dam Operations Manager
Water Delivery
Queensland Bulk Water Supply Authority *trading as Seqwater*

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Technical Situation Report 11

Date: Monday 10 January 2011

Time: 15:27

The Flood Centre will keep you informed or leave messages on your phones. Give them a call if you need further information.

Below is the current strategy.
Any comments or assessments let me know.

Rainfall

Significant rainfall has fallen in the Wivenhoe Dam catchment over the last 3 hours, with falls exceeding 100mm. This rainfall will significantly increase inflows into the dam. A severe weather warning remains current for heavy rainfall in the dam catchment areas. The QPF issued by BOM at 10:00 estimates rainfalls for the 24 hours to 10:00 Tuesday as North Pine Dam (75mm to 150mm); Wivenhoe/Somerset Dam Catchments (50mm – 100mm). Potentially significant rain moving towards the dam catchments is currently evident on the BOM radar.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 103.41m AHD and rising. Peak inflow to the dam is estimated to be about 4,200 m³/s. Five sluice gates are open releasing about 1,100m³/s (95,000ML/day) into Wivenhoe Dam. At this stage the dam lake level will reach about 103.5m AHD on Monday afternoon. Areas around Kilcoy will continue to be adversely affected.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

The dam level is 72.41m AHD and rising quickly. The rainfall experienced over the last 2 to 3 hours will result in significant further inflows into the dam and releases from the dam will need to be increased in accordance with Flood Mitigation procedures and to ensure that a fuse plug is not initiated. The initiation of a fuse plug will result in a rapid uncontrolled outflow from the dam of 2,000m³/s being added to the gate release outflow. Outflows into the Brisbane River from both Lockyer Creek and the Bremer River are also increasing.

Five radial gates are currently open at the dam releasing about 2,000m³/s into the Brisbane River and this will need to be increased steadily to an outflow of 2,800m³/s over the next 9 hours (commencing at 1500). At this stage, the dam will reach about 73.8m AHD during Tuesday morning.

The objective for dam operations is currently to minimise the impact of urban flooding in areas downstream of the dam and to keep river flows in the lower Brisbane River below 4,000m³/s if possible. This is significantly less than the current estimated combined pre-dam peak inflow of 12,000m³/s. If further rainfall occurs, dam releases may need to be increased further and this may result in river flows in the lower Brisbane River approaching or exceeding 5,000m³/s.

Impacts downstream of Wivenhoe Dam

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

The projected Wivenhoe Dam releases combined with Lockyer Creek flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Sunday 16 January in varying degrees.

Water levels in the lower Brisbane River will be impacted by the combined flows of Lockyer Creek, Bremer River, local runoff and releases from Wivenhoe Dam.

Outlook

Heavy rainfall continues throughout South East Queensland and the situation could deteriorate rapidly over the next 24 hours. The flood operation centre will continue to monitor the situation and provide every six hours until the situation stabilizes.

Dam Operations Manager
Water Delivery
Queensland Bulk Water Supply Authority *trading as Seqwater*

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Technical Situation Report 12

Date: Tuesday 11 January 2011

Time: 06:38

The Flood Centre has kept you informed (and discussed with the BCC Flood Centre) of where we are at but below is a summary as at 6am this morning.

I will send off another Technical Report this morning so if you have any assessments or actions you are undertaking that you want included send them in.

Rainfall

Rainfall continues in the North Pine Dam, Somerset Dam and Wivenhoe Dam catchments. Isolated falls in the Upper Brisbane River of up to 125 mm have been recorded with widespread falls of 40 to 70 mm in the Somerset Dam catchment. This rainfall will increase inflows into the dam.

There has also been 20 to 60 mm in the Lockyer Creek catchment in the last 12 hours with falls of up to 30 mm in the Bremer River.

A severe weather warning remains current for heavy rainfall in the dam catchment areas. The QPF issued by BOM at 16:00 estimates rainfalls for the 24 hours to 10:00 Tuesday as North Pine Dam (25mm to 50mm, with isolated falls to 100mm); Wivenhoe/Somerset Dam Catchments (25mm to 50mm, with isolated falls to 100mm).

North Pine Dam (Full Supply Level 39.60 m AHD)

The dam level is 39.80m AHD and has commenced rising again (storing 4,400ML above FSL). Five gates are open releasing 177 m³/s. The inflow into the dam since the commencement of the event is 77,000 ML. Estimated event volume is 88,000 ML assuming no further rainfall. Releases from the dam will continue until at least Wednesday 12 January 2011.

Somerset Dam (Full Supply Level 99.00 m AHD)

The dam level is 103.27m AHD and falling slowly. Peak inflow to the dam is estimated to be about 4,200 m³/s. Total discharge into Wivenhoe Dam is currently 1400 m³/s and this discharge will be decreased in the next few hours to be around 500 m³/s later on Tuesday. This is to ensure that the combined flood mitigation capacity in Somerset and Wivenhoe Dam is maximized.

The dam level peaked at 103.52m AHD at 19:00 on Monday 10 January 2011, (unless further significant rainfall is experienced). Areas around Kilcoy will continue to be adversely affected.

Wivenhoe Dam (Full Supply Level 67.00 m AHD)

The dam level is 73.51m AHD and rising at about 25 mm/hour. Releases from the dam have been held at a rate of 2,750 m³/s since 19:30 hours on Monday 10 January

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

2011. Outflows into the Brisbane River from both Lockyer Creek and the Bremer River are also increasing.

The BoM has provided further advice about the flash flooding experienced in the upper areas of Lockyer Creek. The rainfall responsible for this event was not observed at any rainfall stations but it is considered to be extreme. Flood levels in the Lockyer Creek catchment will exceed maximum recorded levels in some stations in the upper catchment. This flow will result in increases in Brisbane River levels below the junction of Lockyer Creek.

Five radial gates are currently open at the dam releasing about 2,750m³/s into the Brisbane River. At this stage, the dam will reach just over 74.0m AHD during Tuesday evening.

Above EL 74.0m AHD the objective for dam operations is to maintain the security of the dam and minimise downstream flood flows if possible.

If further rainfall occurs, dam releases may need to be increased further and this may result in river flows in the lower Brisbane River approaching or exceeding 5,000m³/s.

Impacts downstream of Wivenhoe Dam

The projected Wivenhoe Dam releases combined with Lockyer Creek flows and local runoff will mean that all crossings downstream of Wivenhoe (Twin Bridges, Fernvale, Savages Crossing, Burtons Bridge, Kholo Bridge, Mt Crosby Weir and Colleges Crossing) will be adversely impacted until at least Sunday 16 January in varying degrees.

Water levels in the lower Brisbane River will be impacted by the combined flows of Lockyer Creek, Bremer River, local runoff and releases from Wivenhoe Dam.

The BoM will provide further information regarding the magnitude of the flash flood event occurring in Lockyer Creek early Tuesday morning. Consideration was given to modifying the releases from Wivenhoe Dam to try to moderate the peak flows emanating from Lockyer Creek but the rainfall in the past 12 hours in the catchment above the dam makes this option not possible. Therefore instead of decreasing releases to accommodate the Lockyer Creek flows, the strategy will endeavour to maintain the current releases until Lockyer Creek peaks.

Outlook

Heavy rainfall continues throughout South East Queensland and the situation could deteriorate over the next 24 hours. The flood operation centre will continue to monitor the situation and provide situation reports every six hours until the situation stabilizes.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Technical Situation Report 13

Date: Wednesday 12 January 2011

Time: 11:30

I haven't been sending many of these as the Flood Centre has been forwarding all their sit reps to you directly which are the same.

However will keep sending these in case there are other issues that may come up or issues you want to raise.

Rainfall

No significant rain has fallen over the catchments in the past twelve hours. Less than 10 to 15 millimeters of rainfall is expected over the next 24-48 hours.

Somerset/Wivenhoe

Somerset Dam has peaked at 105.11 m AHD at 08:00 on 12 January 2011 and the dam is discharging over the spillway.

One Sluice gate has been opened around 11am to assist the draining of the flood storage compartment. Further sluices may be opened during the day to relieve upstream impacts. At 11am Somerset was 105.06m and 716,900ML at 188.7% and dropping slightly.

Wivenhoe Dam peaked at 74.97 m AHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s.

At 11am Wivenhoe Dam was 74.78 m AHD at 2,197,000ML and 188.5% and generally steady.

The releases from Wivenhoe Dam have been temporarily reduced to 2,500 m³/s at 07:30 to allow the peak of Lockyer Creek to enter the Brisbane River. After the downstream peak in the lower Brisbane River has passed, releases will be increased to maximum of 3,500 m³/s. This release will then be maintained to drain the flood storage component within the required 7 days.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be around 2.3 million megalitres.

North Pine

At 11:00 North Pine Dam was 39.77 mAHD and falling and still releasing from 5 gates. North Pine has peaked at 41.11 mAHD at 14:00 on 11 January 1974 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML. It is expected that gates will now not close until Thursday or Friday.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Technical Situation Report 14

Date: Thursday 13 January 2011

Time: 12:46

Attached is an update as at 12pm.

Again let me know of any issues.

Will send one each day.

Rainfall

Rainfall in the last 12 hours is generally below 5mm with isolated falls of up to 15mm in the Stanley, Lockyer and Pine River catchments. There is no significant rain expected for the next 4 days.

Somerset/Wivenhoe

Somerset Dam has peaked at 105.11 mAHD at 06:00 on 12 January 2011. Three sluices are opened as at 1300 12 January 2011 and discharging 1,250 m³/s into Wivenhoe Dam. Sluice gates will be utilised to drain of the flood storage compartment during the next 5 days. Water levels in Somerset Dam will fall slowly in the next 24 hours.

At 12pm Somerset was 103.96m and 642,535ML at 169.2%.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s.

The releases from Wivenhoe Dam had been temporarily reduced to 2,500 m³/s at 07:30 on Wednesday 12 January 2011 to allow the peak of Lockyer Creek to enter the Brisbane River. The Brisbane River has peaked at the Port Office Gauge early Thursday morning. Releases from Wivenhoe Dam will now be managed gradually from 1pm Thursday 13.1.2011 to achieve a target flow of around 3,500 m³/s at Moggill. This release will then be managed to drain the flood storage component within the required 7 days. This will not cause renewed rises downstream.

At 12pm Wivenhoe Dam was 74.61 m AHD at 2,170,100ML and 186.2% and dropping slowly.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

North Pine

At 12pm North Pine Dam still gates open. North Pine peaked at 41.11 mAHD at 14:00 on 11 January 2011 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

At 12pm North Pine Dam was 39.64m AHD and 215,179ML and 100.4% and slowly falling. It is expected that gates will be closed early Friday morning.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels through the Brisbane and Pine catchments and reviewing operating strategy every 30 minutes. The FOC is maintaining close contact with warning agencies and local councils.

Leslie Harrison Dam:

Gates closed.

Hinze Dam:

A release of around 8,000 megalitres a day is being made through the emergency gates. The Lake Level is dropping. There is no public access to the spillway.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Technical Situation Report 15

Date: Friday 14 January 2011

Time: 05:38

Update as of this morning.

As usual, let us know if there are any issues or concerns.

And feel free to contact the Flood Centre for details or discuss.

Rainfall

There has been no significant rainfall in the last 12 hours and none is expected for the next 5 days.

Somerset/Wivenhoe

Somerset Dam has peaked at 105.11 mAHD at 06:00 on 12 January 2011. Four sluices are opened. Sluice gates will be utilised to drain of the flood storage compartment during the next 4 days. Water levels in Somerset Dam will fall slowly in the next 24 hours.

At 5am Somerset was 102.87m and 574,852ML at 151.3% and discharging 1,277cumecs.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s.

The releases from Wivenhoe Dam are being managed to achieve a target flow of around 3,500 m³/s at Moggill. This release will then be maintained to drain the flood storage component within the required 7 days.

At 5am Wivenhoe Dam was 74.08 m AHD at 2,087,960ML and 179.22% and dropping slowly and discharging around 3,500cumecs and this flow will be maintained until early next week.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

North Pine

North Pine peaked at 41.11 mAHD at 14:00 on 11 January 2011 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML

At 5am North Pine Dam was 39.4mAHD and 210,040ML and 98.0% and all gates were closed.

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels through the Brisbane and Pine catchments and reviewing operating strategy every 30 minutes. The FOC is maintaining close contact with warning agencies and local councils.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Technical Situation Report 16

Date: Saturday 15 January 2011

Time: 07:08

Attached is an update as at 6am today.

Again let me know of any issues.

The FOC and the BCC have kept up discussions re any impacts of release strategy. If there are any concerns re effects on houses or recovery that arrive get back to the FOC any time.

Will send one each day.

Aiming to have most of flood storage drained by Wednesday but will have better idea of closing times over next few days. Then may have better idea as to when bridges will come out. But again contact the FOC if you want.

Rainfall

There has been no significant rainfall in the last 24 hours and no significant rainfall is expected in the next twenty-four hours. Mostly fine conditions are expected over the weekend, but showers will return early next week.

Somerset/Wivenhoe

Somerset Dam has peaked at 105.11 mAHD at 06:00 on 12 January 2011. Four sluices are opened. Sluice gates will be utilised to drain of the flood storage compartment during the next 4 days. Water levels in Somerset Dam will fall slowly in the next 24 hours.

At 6am Somerset was 101.35m and 490,137ML at 129.0% and discharging 920cumecs.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s.

The releases from Wivenhoe Dam are being managed to achieve a target flow of around 3,500 m³/s at Moggill. This release will then be maintained to drain the flood storage component by around Wednesday 19th January.

At 5am Wivenhoe Dam was 72.86 m AHD at 1,905,900ML and 163.6% and dropping slowly and discharging around 3,500cumecs and this flow will be maintained.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

North Pine

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

North Pine peaked at 41.11 mAHD at 14:00 on 11 January 2011 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML
At closure North Pine Dam was 39.4mAHD and 210,040ML and 98.0% and all gates were closed. The current level is expected to increase to just over 39.5 mAHD in the next few days due to base-flow. This could be higher if further rainfall occurs.

MBRC will inspect Youngs Crossing to determine if the crossing can be re-opened

Strategy

The Flood Operations Centre is continuing to monitor rainfalls and water levels throughout the Brisbane and Pine River catchments and is maintaining close contact with warning agencies and local councils.

Leslie Harrison Dam:
Gates closed.

Hinze Dam:
A release of around 6,800megalitres a day is being made through the emergency gates. The Lake Level is dropping and the gate should be closed around Tuesday next week. There is no public access to the spillway.

Technical Situation Report 17

Date: Sunday 16 January 2011

Time: 06:39

Attached is an update as at 6am today.

Again let me know of any issues.

The FOC and the BCC have kept up discussions re any impacts of release strategy. If there are any concerns re effects on houses or recovery that arrive get back to the FOC any time.

Will send one each day.

Aiming to have most of flood storage drained by Wednesday but will have better idea of closing times over next few days. Then may have better idea as to when bridges will come out. But again contact the FOC if you want.

Rainfall

There has been no significant rainfall in the last 24 hours and no significant rainfall is expected in the next twenty-four hours. Mostly fine conditions are expected over the weekend, but showers will return early next week.

Somerset/Wivenhoe

Somerset Dam has peaked at 105.11 mAHD at 06:00 on 12 January 2011. Four sluices are opened. Sluice gates will be utilised to drain of the flood storage compartment during the next 4 days. Water levels in Somerset Dam will fall slowly in the next 24 hours.

At 6am Somerset was 100.01m and 424,360ML at 111.7% and discharging 820cumecs.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s.

The releases from Wivenhoe Dam are being managed to achieve a target flow of around 3,500 m³/s at Moggill. This release will then be maintained to drain the flood storage component by around Wednesday 19th January.

At 6am Wivenhoe Dam was 71.3 m AHD at 1,687,269ML and 144.8% and dropping slowly and discharging around 3,477cumecs and this flow will be maintained.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

North Pine

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

North Pine peaked at 41.11 mAHD at 14:00 on 11 January 2011 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML

At 6am North Pine Dam was 39.46mAHD and 211,319ML and 98.6% and all gates were closed. The current level is expected to increase to just over 39.5 mAHD in the next few days due to base-flow. This could be higher if further rainfall occurs.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Technical Situation Report 18

Date: Monday 17 January 2011

Time: 09:46

The FOC is planning to initiate a closing sequence some time this afternoon if levels of the dam are tracking properly.

With final closure Wednesday, probably in the morning at this stage.

They will give you a call later today once they have a better idea of timing.

Rainfall

There has been no significant rainfall in the last 24 hours and no significant rainfall is expected in the next twenty-four hours.

Somerset/Wivenhoe

Somerset Dam peaked at 105.11 mAHD at 06:00 on 12 January 2011.

At 6am Somerset was 99.07m and 382,829ML at 100.8% and discharging through cone valves. All sluices are shut.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s.

The releases from Wivenhoe Dam are being managed to achieve a target flow of around 3,500 m³/s at Moggill. This release will then be maintained to drain the flood storage component by around Wednesday 19th January with a closing sequence to start today some time.

At 6am Wivenhoe Dam was 69.4 m AHD at 1,441,983ML and 123.8% and dropping and discharging around 3,477cumecs and this flow will be maintained until the closing sequence begins. Aim is for final closure on Wednesday.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

North Pine

North Pine peaked at 41.11 mAHD at 14:00 on 11 January 2011 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML

At 6am North Pine Dam was 39.54mAHD and 213,024ML and 99.4% and all gates were closed. The current level is expected to increase to stay around this level. This could be higher if further rainfall occurs.

Strategy

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Technical Situation Report 19

Date: Monday 17 January 2011

Time: 16:37

The FOC initiated closing of the gates at Wivenhoe at 2pm this afternoon.

They will have advised you of this.

Any issues let us know.

Give them a call to discuss the closing sequence if you want.

Rainfall

There has been no significant rainfall in the last 24 hours and no significant rainfall is expected in the next twenty-four hours.

Somerset/Wivenhoe

Somerset Dam peaked at 105.11 mAHD at 06:00 on 12 January 2011.

At 4pm Somerset was 99.02m and 380,700ML at 100.2% and discharging through cone valves. All sluices are shut.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s.

At 4pm Wivenhoe Dam was 68.66 m AHD at 1,352,706ML and 116.1% and dropping. The closing sequence started at 2pm today and releases will be slowly decreased through gate closures over the next few days to reach FSL around Thursday morning.

Discussions with BCC indicated they would prefer a Thursday closure to increase release time and minimize possible impacts re slumping along Coronation Drive. They also would like closure no later than Thursday prior to predicted high tides late this week.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

North Pine

North Pine peaked at 41.11 mAHD at 14:00 on 11 January 2011 with peak release of 2,800 m³/s. The event has a volume of around 200,000 ML

At 4pm North Pine Dam was 39.54mAHD and 213,024ML and 99.4% and all gates were closed. The current level is expected to increase to stay around this level. This could be higher if further rainfall occurs.

APPENDIX F – COMMUNICATION PROTOCOL TECHNICAL SITUATION REPORTS (continued)

Technical Situation Report 20

Date: Tuesday 18 January 2011

Time: 06:51

The FOC initiated closing of the gates at Wivenhoe at 2pm this afternoon aiming at final closure Thursday morning.

Any issues let us know.

Give them a call to discuss the closing sequence if you want.

Rainfall

There has been no significant rainfall in the last 24 hours and no significant rainfall is expected in the next twenty-four hours. Mostly fine conditions are expected over the weekend, but showers will return early next week.

Somerset/Wivenhoe

Somerset Dam peaked at 105.11 mAHD at 06:00 on 12 January 2011.

At 6am Somerset was 98.98m and 379,016ML at 99.8% and discharging through one cone valve. All sluices are shut.

Wivenhoe Dam peaked at 74.97 mAHD at 19:00 on 11 January 2011 with a corresponding discharge of 7,450 m³/s.

At 6am Wivenhoe Dam was 67.82 m AHD at 1,255,638ML and 107.8% and dropping.

Releases were held constant overnight at about 2,050 m³/s to assist water supply pumping at Lowood. Following discussions with water supply operators, it has been decided to resume closing gates at 09:00 Tuesday before final closure on Thursday morning. The Dam will be near full supply and releases will be made through the regulator to account for ongoing base-flow.

Discussions with BCC indicated they would prefer a Thursday closure to increase release time and minimize possible impacts re slumping along Coronation Drive. They also would like closure no later than Thursday prior to predicted high tides late this week.

The combined flood event volume in Somerset and Wivenhoe Dams is estimated to be in excess of 2.6 million megalitres.

It should be noted that the Seqwater water level gauge currently being reported on the BoM website is currently slightly under reading by about 50mm.

APPENDIX G – SEVERE WEATHER WARNINGS

THUNDERSTORM WARNINGS

Thunderstorm Warning 1

Date: Wednesday 5 January 2011

Time: 16:22

From: Aifs Operational Manager
Sent: Wednesday, January 05, 2011 4:22:08 PM
To: weather
Subject: BOM: Severe Thunderstorm Warning - SE Qld 1 [SEC=UNCLASSIFIED] Auto forwarded by a Rule

IDQ20038
Bureau of Meteorology
Queensland Regional Office

TOP PRIORITY FOR IMMEDIATE BROADCAST

SEVERE THUNDERSTORM WARNING - SOUTHEAST QUEENSLAND for DAMAGING WIND, FLASH FLOODING and LARGE HAILSTONES For people in parts of the BRISBANE CITY, LOCKYER VALLEY, MORETON BAY and SOMERSET Council Areas.

Issued at 4:19 pm Wednesday, 5 January 2011.

The Bureau of Meteorology warns that, at 4:20 pm, severe thunderstorms were detected on weather radar near Esk and northern Lake Wivenhoe.

They are forecast to affect the area south of Esk by 4:50 pm and southern Lake Wivenhoe by 5:20 pm.

Damaging winds, very heavy rainfall, flash flooding and large hailstones are likely.

Emergency Management Queensland advises that people should:

- * Move your car under cover or away from trees.
- * Secure loose outdoor items.
- * Avoid driving, walking or riding through flood waters.
- * Seek shelter, preferably indoors and never under trees.
- * Avoid using the telephone during a thunderstorm.
- * Beware of fallen trees and powerlines.
- * For emergency assistance contact the SES on 132 500.

The next warning is due to be issued by 5:20 pm.

Warnings are also available through TV and Radio broadcasts, the Bureau's website at www.bom.gov.au or call 1300 659 219. The Bureau and Emergency Management Queensland would appreciate warnings being broadcast regularly.

TOP PRIORITY FOR IMMEDIATE BROADCAST

SEVERE THUNDERSTORM WARNING - SOUTHEAST QUEENSLAND for DAMAGING WIND, FLASH FLOODING and LARGE HAILSTONES For people in the LOGAN CITY and parts of the BRISBANE CITY, GOLD COAST CITY, IPSWICH CITY and SCENIC RIM Council Areas.

Issued at 2:52 pm Tuesday, 18 January 2011.

The Bureau of Meteorology warns that, at 2:55 pm, very dangerous thunderstorms were detected on weather radar near the area between Boonah and Beaudesert and Peak Crossing.

These thunderstorms are slow moving.

Very dangerous thunderstorms are forecast to affect Tamborine, Jimboomba and Bundamba Lagoon by 3:25 pm and Greenbank, Redbank Plains and Amberley by 3:55 pm.

Damaging winds, very heavy rainfall, flash flooding and large hailstones are likely.

Emergency Management Queensland advises that people should:

- * Move your car under cover or away from trees.
- * Secure loose outdoor items.
- * Avoid driving, walking or riding through flood waters.
- * Seek shelter, preferably indoors and never under trees.
- * Avoid using the telephone during a thunderstorm.
- * Beware of fallen trees and powerlines.
- * For emergency assistance contact the SES on 132 500.

The next warning is due to be issued by 3:55 pm.

Warnings are also available through TV and Radio broadcasts, the Bureau's website at www.bom.gov.au or call 1300 659 219. The Bureau and Emergency Management Queensland would appreciate warnings being broadcast regularly.

TOP PRIORITY FOR IMMEDIATE BROADCAST

SEVERE THUNDERSTORM WARNING - SOUTHEAST QUEENSLAND for DAMAGING WIND, FLASH FLOODING and LARGE HAILSTONES For people in the SCENIC RIM and parts of the GOLD COAST CITY, LOCKYER VALLEY, IPSWICH CITY, SOUTHERN DOWNS and TOOWOOMBA Council Areas.

Issued at 4:47 pm Wednesday, 19 January 2011.

The Bureau of Meteorology warns that, at 4:50 pm, severe thunderstorms were detected on weather radar near Coolangatta, the area southwest of Toowoomba, Border Ranges National Park and the NSW border.

These thunderstorms are moving towards the east to northeast.

They are forecast to affect the area northwest of Toowoomba, Laravale and Miami by 5:20 pm and Toowoomba, the area south of Toowoomba and Highfields by 5:50 pm.

Damaging winds, very heavy rainfall, flash flooding and large hailstones are likely.

2cm hail was observed at Oakey

Emergency Management Queensland advises that people should:

- * Move your car under cover or away from trees.
- * Secure loose outdoor items.
- * Avoid driving, walking or riding through flood waters.
- * Seek shelter, preferably indoors and never under trees.
- * Avoid using the telephone during a thunderstorm.
- * Beware of fallen trees and powerlines.
- * For emergency assistance contact the SES on 132 500.

The next warning is due to be issued by 5:50 pm.

A more general severe thunderstorm warning is also current for the Wide Bay and Burnett, Southeast Coast and parts of the Northern Tropical Coast and Tablelands, Central Highlands and Coalfields, Central West, Capricornia, Maranoa and Warrego and Darling Downs and Granite Belt districts.

TOP PRIORITY FOR IMMEDIATE BROADCAST

SEVERE THUNDERSTORM WARNING
for DAMAGING WIND and FLASH FLOODING

For people in the Wide Bay and Burnett, Southeast Coast and parts of the Central Highlands and Coalfields, Capricornia and Darling Downs and Granite Belt Forecast Districts.

Issued at 9:11 pm Wednesday, 19 January 2011.

Severe thunderstorms are likely to produce damaging winds, very heavy rainfall and flash flooding in the warning area over the next several hours. Locations which may be affected include Warwick, Toowoomba, Brisbane, Dalby, Maroochydore, Gympie, Bundaberg and Kingaroy.

Emergency Management Queensland advises that people should:

- * Move your car under cover or away from trees.
- * Secure loose outdoor items.
- * Avoid driving, walking or riding through flood waters.
- * Seek shelter, preferably indoors and never under trees.
- * Avoid using the telephone during a thunderstorm.
- * Beware of fallen trees and powerlines.
- * For emergency assistance contact the SES on 132 500.

The next warning is due to be issued by 12:15 am Thursday.

If severe thunderstorms develop in the Southeast Queensland area [east of Dalby from Rainbow Beach to Stanthorpe], a more detailed Severe Thunderstorm Warning will be issued to people in this area.

Warnings are also available through TV and Radio broadcasts, the Bureau's website at www.bom.gov.au or call 1300 659 219. The Bureau and Emergency Management Queensland would appreciate warnings being broadcast regularly.

TOP PRIORITY FOR IMMEDIATE BROADCAST

CANCELLATION SEVERE THUNDERSTORM WARNING - SOUTHEAST QUEENSLAND

Issued at 9:12 pm Wednesday, 19 January 2011.

Severe thunderstorms are no longer affecting the Southeast Queensland area [east of Dalby from Rainbow Beach to Stanthorpe].

The immediate threat of severe thunderstorms has passed, but the situation will continue to be monitored and further warnings will be issued if necessary.

Emergency Management Queensland advises that people should:

- * Beware of fallen trees and powerlines.
- * Avoid driving, walking or riding through flood waters.
- * For emergency assistance contact the SES on 132 500.

A more general severe thunderstorm warning remains current for the Wide Bay and Burnett, Southeast Coast and parts of the Central Highlands and Coalfields, Capricornia and Darling Downs and Granite Belt districts.

Warnings are also available through TV and Radio broadcasts, the Bureau's website at www.bom.gov.au or call 1300 659 219. The Bureau and Emergency Management Queensland would appreciate warnings being broadcast regularly.

WEATHER WARNINGS

Weather Warning 1

Date: Wednesday 5 January 2011

Time: 16:59

From: Aifs Operational Manager
Sent: Wednesday, January 05, 2011 4:59:15 PM
To: weather
Subject: BOM: Severe Weather Warning 1 [SEC=UNCLASSIFIED] Auto forwarded by a Rule

IDQ20032
Australian Government Bureau of Meteorology Queensland

TOP PRIORITY FOR IMMEDIATE BROADCAST SEVERE WEATHER WARNING

for heavy rainfall leading to localised flash flooding and potentially worsening the existing river flood situation For people in the Darling Downs and Granite Belt, Southeast Coast, Wide Bay and Burnett, Capricornia and Central Highlands and Coalfields district.

Issued at 5:00 pm on Wednesday 5 January 2011

Synoptic Situation: At 4pm EST, a trough extended from northwestern Queensland into the Darling Downs. The trough is expected to intensify as it moves slowly east over the next 24 hours.

Thundery rain areas with some heavy falls are occurring over the Darling Downs and Granite Belt, Southeast Coast districts and southern parts of the Wide Bay and Burnett and Central Highlands and Coalfields districts. This heavy rain is expected to extend to the Capricornia and remaining parts of the Wide Bay and Burnett and eastern Central Highlands and Coalfields during Thursday. The rain will ease over the western Darling Downs and southwestern Central Highlands and Coalfields on Thursday.

Heavy rainfall may lead to localised flash flooding and/or worsen current river flooding.

Heavy rainfall has eased over the Maranoa District and a Severe Weather Warning for this area is no longer current.

Flood warnings are current for various rivers and streams in these districts; refer to these products [www.bom.gov.au/qld] for further information.

The State Emergency Service advises that people in the affected area should:
avoid driving, walking or riding through flood waters take care on the roads, especially in heavy downpours avoid swimming in swollen rivers and creeks

Contact the SES on 132 500 for emergency assistance if required.

The next warning is due to be issued by 11:00 pm Wednesday

APPENDIX G – SEVERE WEATHER WARNINGS (continued)

This warning is also available through TV and Radio broadcasts; the Bureau's website at www.bom.gov.au or call 1300 659 219. The Bureau and State Emergency Service would appreciate this warning being broadcast regularly.

TOP PRIORITY FOR IMMEDIATE BROADCAST SEVERE WEATHER WARNING

for heavy rainfall leading to localised flash flooding and potentially worsening the existing river flood situation For people in the Southeast Coast and eastern parts of the Wide Bay and Burnett districts.

Issued at 4:50 pm on Thursday 6 January 2011

Synoptic Situation: At 4pm EST, an upper level low was developing over the southeastern interior of Queensland and is forecast to move in a north northeast direction overnight. A slow moving surface trough extended from northwestern parts of the state down into the southeast.

Rain areas and thunderstorms will continue through parts of the Southeast Coast district north of Brisbane and eastern parts of the Wide Bay and Burnett district this evening and overnight. Some heavy falls are expected which may lead to localised flash flooding and/or worsen existing river flooding.

Rain areas and thunderstorms have eased in parts of the Southeast Coast district south of Brisbane but may redevelop overnight. Heavy rain areas are forecast to contract into eastern parts of the Wide Bay and Burnett district on Friday.

Isolated thunderstorms are expected through the Capricornia and remaining parts of the Wide Bay and Burnett District. Locally heavy falls may occur today with these thunderstorms and Severe Thunderstorm Warnings will be issued as necessary.

Flood warnings are current for various rivers and streams in these districts; refer to these products [www.bom.gov.au/qld] for further information.

Weather Warning 16

Date: Saturday 8 January 2011

Time: 11:00

From: Aifs Operational Manager
Sent: Saturday, January 08, 2011 11:00:01 AM
To: weather
Subject: BOM: Severe Weather Warning 1 [SEC=UNCLASSIFIED] Auto forwarded by a Rule

IDQ20032
Australian Government Bureau of Meteorology Queensland

TOP PRIORITY FOR IMMEDIATE BROADCAST SEVERE WEATHER WARNING

for heavy rainfall leading to localised flash flooding and potentially worsening the existing river flood situation For people in the Southeast Coast and Wide Bay and Burnett districts.

Issued at 11:00 am on Saturday 8 January 2011

Synoptic Situation: At 10am EST, an upper level low was located offshore from the Capricornia district while a low level trough was located off the southern coast.

Heavy rain overnight has weakened recently to showers and isolated thunderstorms. Rain areas are expected to return to the Southeast Coast and Wide Bay and Burnett districts from this afternoon, and increase to moderate to heavy falls at times tonight and Sunday. Heavy rain may lead to localised flash flooding and/or worsen existing river flooding.

Recent events: Rainfall of up to 304mm over the Mary River catchment in the 24 hours to 9am Saturday. A Flood Warning is current for this area.

Flood warnings are current for various rivers and streams in these districts; refer to these products [www.bom.gov.au/qld] for further information.

The State Emergency Service advises that people in the affected area should:
avoid driving, walking or riding through flood waters take care on the roads, especially in heavy downpours avoid swimming in swollen rivers and creeks

Contact the SES on 132 500 for emergency assistance if required.

The next warning is due to be issued by 5pm Saturday

This warning is also available through TV and Radio broadcasts; the Bureau's website at www.bom.gov.au or call 1300 659 219. The Bureau and State Emergency Service would appreciate this warning being broadcast regularly.

TOP PRIORITY FOR IMMEDIATE BROADCAST SEVERE WEATHER WARNING

for heavy rainfall leading to localised flash flooding and potentially worsening the existing river flood situation For people in the Southeast Coast district, southern parts of the Wide Bay and Burnett district and eastern parts of the Darling Downs and Granite Belt district.

Issued at 11:05 am on Monday 10 January 2011

Synoptic Situation: At 10am EST, an upper level low was located over the southwest of the Capricornia District. A surface trough was located off the southeast coast. Both of these systems are moving slowly west.

Heavy rain areas and thunderstorms are expected to continue through the Southeast Coast district, far southern parts of the Wide Bay and Burnett District and eastern parts of the Darling Downs and Granite Belt district. Heavy falls may lead to localised flash flooding and/or worsen existing river flooding.

The heavy rain areas and thunderstorms are expected to contract southwards into the Southeast Coast district and southeast parts of the Darling Downs and Granite Belt district during Tuesday.

Recent events: In the 24 hours to 9am EST Monday morning, Maleny received 321mm, West Bellthorpe 310 mm and Peachester 298 mm.

Flood warnings are current for various rivers and streams in these districts; refer to these products [www.bom.gov.au/qld] for further information.

The State Emergency Service advises that people in the affected area should:
avoid driving, walking or riding through flood waters take care on the roads, especially in heavy downpours avoid swimming in swollen rivers and creeks

Contact the SES on 132 500 for emergency assistance if required.

The next warning is due to be issued by 5 pm Monday.

This warning is also available through TV and Radio broadcasts; the Bureau's website at www.bom.gov.au or call 1300 659 219. The Bureau and State Emergency Service would appreciate this warning being broadcast regularly.

APPENDIX G – SEVERE WEATHER WARNINGS (continued)

Weather Warning 26

Date: Monday 10 January 2011

Time: 17:06

From: Aifs Operational Manager
Sent: Monday, January 10, 2011 5:06:14 PM
To: weather
Subject: BOM: Severe Weather Warning 1 [SEC=UNCLASSIFIED] Auto forwarded by a Rule

TOP PRIORITY FOR IMMEDIATE BROADCAST SEVERE WEATHER WARNING

for heavy rainfall leading to localised flash flooding and potentially worsening the existing river flood situation For people in the Southeast Coast district, far southern parts of the Wide Bay and Burnett district and eastern parts of the Darling Downs and Granite Belt district.

Issued at 5:05 pm on Monday 10 January 2011

Synoptic Situation: At 4pm EST, an upper level low was located over the west of the Wide Bay and Burnett district. A surface trough was located off the east Queensland coast. The upper low is forecast to move southwest over the southern interior of Queensland while the surface trough remains slow moving.

Heavy rain areas and thunderstorms are expected to continue through the Southeast Coast district and eastern parts of the Darling Downs and Granite Belt district. Heavy falls may lead to localised flash flooding and/or worsen existing river flooding.

The heavy rain areas and thunderstorms are expected to contract southwards and gradually ease in the Southeast Coast district and eastern parts of the Darling Downs and Granite Belt district later on Tuesday.

Rainfall has eased in far southern parts of the Wide Bay and Burnett district and therefore the warning for this district is now CANCELLED.

Recent events: In the 24 hours to 9am EST Monday, Maleny received 321mm, West Bellthorpe 310 mm and Peachester 298 mm.
In the 7 hours since 9am EST Monday, Redbank Creek received 126mm, Toowoomba Airport 88mm and Mt Castle 80mm.

Flood warnings are current for various rivers and streams in these districts; refer to these products [www.bom.gov.au/qld] for further information.

The State Emergency Service advises that people in the affected area should:
avoid driving, walking or riding through flood waters take care on the roads, especially in heavy downpours avoid swimming in swollen rivers and creeks

Contact the SES on 132 500 for emergency assistance if required.

APPENDIX G – SEVERE WEATHER WARNINGS (continued)

The next warning is due to be issued by 11pm Monday.

This warning is also available through TV and Radio broadcasts; the Bureau's website at www.bom.gov.au or call 1300 659 219. The Bureau and State Emergency Service would appreciate this warning being broadcast regularly.

Transmitters in the areas of the Southeast Coast District and the Darling Downs and Granite Belt District southeast of Dalby to Goondiwindi are REQUESTED TO USE THE STANDARD EMERGENCY WARNING SIGNAL BEFORE BROADCASTING.

**TOP PRIORITY FOR IMMEDIATE BROADCAST
SEVERE WEATHER WARNING**

for heavy rainfall leading to flash flooding and worsening the existing river flood situation
For people in the Southeast Coast District and the Darling Downs and Granite Belt District southeast of Dalby to Goondiwindi.

Issued at 2:00 pm on Tuesday 11 January 2011

Synoptic Situation: At 2 pm AEST, a surface trough was lying over the Southeast Queensland Coast and is expected to weaken overnight.

Heavy rain areas and local thunderstorms are expected to continue through the Southeast Coast and the Darling Downs and Granite Belt District southeast of Dalby to Goondiwindi. Heavy falls will lead to flash flooding and will worsen existing river flooding.

Currently the focus of the heaviest rainfall extends from about Maroochydore to Warwick, including the Brisbane and Lockyer Valleys and Ipswich area. Recent rainfall rates in this band have reached 60 to 80 mm per hour. This rainfall band is expected to remain slow moving during the remainder of today and gradually weaken overnight and during Wednesday morning.

Flood warnings are current for various rivers and streams in these districts. Please refer to these products [www.bom.gov.au/qld] for further information.

The State Emergency Service advises that people in the affected area should:
avoid driving, walking or riding through flood waters take care on the roads, especially in heavy downpours avoid swimming in swollen rivers and creeks

Contact the SES on 132 500 for emergency assistance if required.

The next warning is due to be issued by 5 pm AEST Tuesday.

This warning is also available through TV and Radio broadcasts; the Bureau's website at www.bom.gov.au or call 1300 659 219. The Bureau and State Emergency Service would appreciate this warning being broadcast regularly.

Transmitters in areas of the Southeast Coast district and the Darling Downs and Granite Belt district southeast of Dalby to Goondiwindi are REQUESTED TO USE THE STANDARD EMERGENCY WARNING SIGNAL BEFORE BROADCASTING.

**TOP PRIORITY FOR IMMEDIATE BROADCAST
SEVERE WEATHER WARNING**

for heavy rainfall leading to flash flooding and worsening the existing river flood situation
For people in the Southeast Coast District and the Darling Downs and Granite Belt District southeast of Dalby to Goondiwindi.

Issued at 5:00 pm on Tuesday 11 January 2011

Synoptic Situation: At 4 pm AEST, southeast Queensland was under the influence of a deep moist easterly airstream, with an upper trough located over the Darling Downs.

Heavy rain areas and local thunderstorms are expected to continue tonight through the Southeast Coast and the Darling Downs and Granite Belt District southeast of Dalby to Goondiwindi. Heavy falls will lead to further localised flash flooding and will worsen existing river flooding.

The heavy rain areas are expected to gradually weaken overnight and during Wednesday morning.

Flood warnings are current for various rivers and streams in these districts.
Please refer to these products [www.bom.gov.au/qld] for further information.

The State Emergency Service advises that people in the affected area should:
avoid driving, walking or riding through flood waters take care on the roads, especially in heavy downpours avoid swimming in swollen rivers and creeks

Contact the SES on 132 500 for emergency assistance if required.

The next warning is due to be issued by 11 pm AEST Tuesday.

This warning is also available through TV and Radio broadcasts; the Bureau's website at www.bom.gov.au or call 1300 659 219. The Bureau and State Emergency Service would appreciate this warning being broadcast regularly.

APPENDIX G – SEVERE WEATHER WARNINGS (continued)

Weather Warning 35

Date: Tuesday 11 January 2011

Time: 21:59

From: Aifs Operational Manager
Sent: Tuesday, January 11, 2011 9:59:57 PM
To: weather
Subject: BOM: Severe Weather Warning 1 [SEC=UNCLASSIFIED] Auto forwarded by a Rule

IDQ20032
Australian Government Bureau of Meteorology Queensland

Note: The Standard Emergency Warning Signal is no longer required.

TOP PRIORITY FOR IMMEDIATE BROADCAST
CANCELLATION - SEVERE WEATHER WARNING

For people in the Southeast Coast District and the Darling Downs and Granite Belt District southeast of Dalby to Goondiwindi.

Issued at 10:00 pm on Tuesday 11 January 2011

Synoptic Situation: At 10 pm AEST, southeast Queensland was under the influence of a deep moist east to northeast airstream. A weakening upper trough was moving south.

Heavy rain areas have eased during the past few hours and further flash flooding due to rainfall is no longer expected.

Note that an extremely serious river and stream flood situation still exists. Refer to flood warnings [www.bom.gov.au/qld] for further information.

The State Emergency Service advises that people in the affected area should:
avoid driving, walking or riding through flood waters avoid swimming in swollen rivers and creeks

Contact the SES on 132 500 for emergency assistance if required.

No further warnings are expected to be issued for this event

This warning is also available through TV and Radio broadcasts; the Bureau's website at www.bom.gov.au or call 1300 659 219. The Bureau and State Emergency Service would appreciate this warning being broadcast regularly.

APPENDIX J – FORECAST RAINFALL COMPARISON

Seqwater commenced development of a new flood modelling system, FEWS, in March 2010. A prototype was delivered in early November 2010 at which time forecast rainfall from the Bureau's ACCESS Numerical Weather Prediction models was ingested into the system several times per day. These models cover different coverage at varying resolutions and are generated at different times of the day. The results of the models are merged, downscaled to the Brisbane area and gridded to produce forecast the images below. The grid of the actual rainfall is based upon all available ALERT stations in the Enviromon data collection system and is generated by FEWS using surface fitting techniques.

Model	Domain	Resolution (km)	Duration (hours)	Runs (UTC)
ACCESS-G	Global	~80	+240	00,12
ACCESS-R	Regional	~37.5	+72	00,12
ACCESS-T	Tropical	~37.5	+72	00,12
ACCESS-A	Australia	~12	+48	00,06,12,18
ACCESS-BR	Brisbane	~5	+36	00,12

A full description of the ACCESS Numerical Weather Prediction models can be found on BoM's web site.

While FEWS outputs were not available during the Event, the forecast rainfalls used (QPF, Silo and Interactive Weather and Wave Maps) are based upon the ACCESS model outputs.

The scale shown below has been adopted in all of the maps below and indicates the rainfall depth in millimetres.

APPENDIX J – FORECAST RAINFALL COMPARISON (continued)

The table below shows a comparison of the progressive forecast and recorded rainfall fields for 24 hour periods commencing at 0900 5 January 2011. The first row shows the actual rainfall for the 24 hours at the end of the forecast period while the row below shows the rainfall that was forecast for the 24 hour periods for the days following the start date.

Table of Progressive 24 Hours Forecast and Actual Rainfalls

APPENDIX K – 3-DAY ASSESSMENTS AND MODEL RESULTS

Date: Sunday 9 January 2011
Time: 11:02

From: Duty Engineer
Sent: Sunday, 9 January 2011 11:02 AM
To: Distribution List
Cc: Distribution List
Subject: Forecast Rainfall and Possible Runoff

Forecast Rainfall

The forecast for the next few days is for heavy rainfall, particularly for period 10pm Sunday to 10pm Monday with totals between 200-300mm. The areas mostly heavily impacted will be the North Pine, Somerset and Leslie Harrison catchments with less rain in the upper Brisbane
<http://www.bom.gov.au/jsp/watl/rainfall/pme.jsp>

The rain contracts to the area around North Pine for the period 10pm Monday to 10pm Tuesday with totals in the order of 100 to 150mm.

The interactive model at <http://www.bom.gov.au/australia/charts/viewer/index.shtml> shows the heaviest falls during the next 48 hours are likely to be overnight Sunday/Monday and overnight Monday/Tuesday.

The QPF for the period 24 hours to 9am show totals between 40- 60mm for both North Pine and Somerset/Wivenhoe catchments. Note that this is only half the period of the above forecast durations.

Recorded Runoff

To date recorded inflows to the dams since 02/01/2011 have been

North Pine	23,000ML
Somerset	120,000ML
Wivenhoe	380,000ML (including Somerset outflow)

Presently, the conversion rate between rainfall and runoff is about 0.45 for Wivenhoe, 0.60 for North Pine and 0.75 for Somerset.

Expected Runoff

Based on the approximate runoff conversion rates and the forecast rainfall, estimated runoff volumes (ML) generated could be of the order of:

Catchment	Monday	Tuesday	Wednesday	Three Day Total
North Pine	10,000-20,000	35,000-55,000	25,000-35,000	70,000-110,000
Somerset	50,000-100,000	200,000-300,000	75,000-150,000	325,000-550,000
Wivenhoe	125,000-250,000	250,000-500,00	125,000-250,000	500,000-1,000,000

The lower limit of the inflow to Somerset and Wivenhoe will be similar to the October 2010 flood while the upper limit is similar to the February 1999 floods. However, the starting level of the dams is much higher than in these historical events.

This points to continued flood operations for Somerset and Wivenhoe until at least the weekend of 15/16 Jan and maybe a shorter time for North Pine.

APPENDIX K – 3-DAY ASSESSMENTS AND MODEL RESULTS (continued)

It should be noted that these estimates are based upon forecast rainfall which may or may not eventuate.

Subject: Forecast Rainfall and Possible Runoff
Forecast Rainfall

The forecast for the next few days is for heavy rainfall, particularly for period 10pm Sunday to 10pm Monday with totals between 200-300mm. The areas mostly heavily impacted will be the North Pine, Somerset and Leslie Harrison catchments with less rain in the upper Brisbane
<http://www.bom.gov.au/isp/wat/rainfall/pme.jsp>

The rain contracts to the area around North Pine for the period 10pm Monday to 10pm Tuesday with totals in the order of 100 to 150mm.

The interactive model at <http://www.bom.gov.au/australia/charts/viewer/index.shtml> shows the heaviest falls during the next 48 hours are likely to be overnight Sunday/Monday and overnight Monday/Tuesday.

The QPF for the period 24 hours to 9am show totals between 40- 60mm for both North Pine and Somerset/Wivenhoe catchments. Note that this is only half the period of the above forecast durations.

Recorded Runoff

To date recorded inflows to the dams since 02/01/2011 have been

North Pine 23,000ML
Somerset 120,000ML
Wivenhoe 380,000ML (including Somerset outflow)

Presently, the conversion rate between rainfall and runoff is about 0.45 for Wivenhoe, 0.60 for North Pine and 0.75 for Somerset.

Expected Runoff

Based on the approximate runoff conversion rates and the forecast rainfall, estimated runoff volumes (ML) generated could be of the order of:

Catchment	Monday	Tuesday	Wednesday	Three Day Total
North Pine	10,000-20,000	35,000-55,000	25,000-35,000	70,000-110,000
Somerset	50,000-100,000	200,000-300,000	75,000-150,000	325,000-550,000
Wivenhoe	125,000-250,000	250,000-500,00	125,000-250,000	500,000-1,000,000

The lower limit of the inflow to Somerset and Wivenhoe will be similar to the October 2010 flood while the upper limit is similar to the February 1999 floods. However, the starting level of the dams is much higher than in these historical events.

This points to continued flood operations for Somerset and Wivenhoe until at least the weekend of 15/16 Jan and maybe a shorter time for North Pine.

APPENDIX K – 3-DAY ASSESSMENTS AND MODEL RESULTS (continued)

It should be noted that these estimates are based upon forecast rainfall which may or may not eventuate.

1.1.1 Flood Event - Operations Directive

TO: Wivenhoe Dam Operators	Date: 07/01/2011 Time: 12:00 Directive No: 01
-----------------------------------	--

This transmission comprises of this page and 0 other pages.

Message:

The Wivenhoe Dam lake level was 67.81m AHD and rising slowly at 11:00 Friday 07/01/2011.

Prior to gate operations, please close the regulator.

The following gate operations should be undertaken commencing at 15:00 07/01/2011

07/01/2011 15:00	Open Gate 3	from 0.0 metres to 0.5 metres
07/01/2011 16:00	Open Gate 3	from 0.5 metres to 1.0 metres
07/01/2011 17:00	Open Gate 3	from 1.0 metres to 1.5 metres
07/01/2011 18:00	Open Gate 3	from 1.5 metres to 2.0 metres
07/01/2011 19:00	Open Gate 3	from 2.0 metres to 2.5 metres
07/01/2011 20:00	Open Gate 3	from 2.5 metres to 3.0 metres
07/01/2011 21:00	Open Gate 3	from 2.5 metres to 3.5 metres

By 21:30, Gate 3 will be open 3.5 metres and releasing approximately 400m³/s.

It is noted that the hydro will continuing releasing 13 m³/s.

Please advise the Flood Operations Centre by fax once you have opened the radial gate to each of the required opening.

1.1.65 Flood Event - Operations Directive

TO: Somerset Dam Operators	Date: 08/01/2011
	Time: 11:30
	Directive No: 3

This transmission comprises of this page and 0 other pages.

Message:

Somerset Dam is expected to peak at around mid-day at about EL 100.48 m. As we have exceeded EL 100.45 m (fixed crest level), but Wivenhoe Dam is still rising we will need to implement Strategy S2.

This strategy is aimed at maximising the benefits of the mitigation storage in both Somerset and Wivenhoe dams. Consequently we will endeavour to follow the target line as defined in the manual.

- Please open Sluice M to 100% at 12:00.

Please confirm this gate operation by fax once you have completed the opening.

Regards

Engineer 1
Duty Engineer

APPENDIX M – FLOOD EVENT LOG

Note: The names of individuals have been removed from this version of the Flood Event log.

DRAFT ONLY - THIS DOCUMENT CONTAINS NO CHECKED OR VERIFIED INFORMATION

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
Thursday 6 January 2011	7:00 AM	<p>Engineer 2 Duty Engineer. Rainfall and water had been remote monitored to this point in time. Engineer 2 advises Senior Duty Engineer that Flood Operations are required at Somerset, Wivenhoe and North Pine Dams. Engineer 2 arrived at FOC to assess strategies and mobilises FOC, Wivenhoe, Somerset and North Pine Dam.</p> <p><u>North Pine Dam</u> At 07:00hrs Thursday, North Pine Dam was 39.60m, 0.05m below gate trigger level and having risen 0.18m since 2/1/2011 due to a combination of base flow and runoff from rain in the last 24 hours. Given the forecast rain, gate operations will commence tonight. MBRC will be advised this morning.</p> <p><u>Somerset Dam</u> At 07:00hrs Thursday, Somerset Dam was 99.34m, 0.34m above FSL, and rising slowly. The rain in the Stanley River catchment has produced a small amount of runoff in the upper Stanley but there have been significant rises in Kilcoy Ck. Further regulator operations will be required later Thursday.</p> <p><u>Wivenhoe Dam</u> The regulator and hydro were discharging at 50 cumecs to manage baseflow recession from previous flow event. At 07:00hrs Thursday, Wivenhoe Dam was 67.31m and rising slowly. This is 0.31m above FSL and above the gate trigger level of 67.25m. There have been rises recorded at rivers and stream upstream of Wivenhoe Dam. Gates will be opened in the next 24 hours to manage the inflows from the upper Brisbane River and the outflow from Somerset.</p>	Situation Report	Flood Officer 7
	8:00 AM	SDWD Model Updated - SDWD-201101060800.xls	Model Run	Flood Officer 9
	8:00 AM	NPD model updated - NPD-201101060800.xls	Model Run	Flood Officer 9
	8:30 AM	Flood Officer 7 spoke with Stand-in Central Coordinator about readiness of staff for flood operations. He confirms that staff have been rostered and are ready.	Correspondence	Flood Officer 7
	8:50 AM	MBRC called to query about flows are Fernvale Bridge. Engineer 2 provided an update for possible gate operations.	Correspondence	Flood Officer 7
	9:05 AM	Call to inform that North Pine Dam staff have been rostered and are ready.	Correspondence	Flood Officer 7
	9:40 AM	Dam Operations Manager called to inform that Ipswich City Council (ICC) has returned to the office and is contactable. They also requested for a situation update.	Correspondence	Flood Officer 7
	11:00 AM	ICC called for a situation update. Engineer 2 shared the release strategy for tonight.	Correspondence	Flood Officer 7
	11:49 AM	Engineer 2 advised MBRC Call Centre that North Pine Dam will commence gate operations tonight. He requested for MBRC to call him.	Correspondence	Flood Officer 7
	12:00 PM	SDWD Model Updated - SDWD-201101061200.xls	Model Run	Flood Officer 9
12:04 PM	MBRC called. Engineer 2 advised her that the latest North Pine Dam gates may be opened will be 7:00pm today. FOC will advise them accordingly.	Correspondence	Flood Officer 7	

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	12:43 PM	MBRC called. Engineer 2 advised that water will be over Savages Crossing until end of the week.	Correspondence	Flood Officer 7
	12:46 PM	Engineer 2 advised BCC Wivenhoe Dam will commence gate operations later today.	Correspondence	Flood Officer 7
	1:30 PM	Revised Operating Strategy 1200 6/1/2011	Situation Report	Engineer 2
	1:32 PM	Engineer 2 left message for SRC to return his call.	Correspondence	Flood Officer 7
	1:35 PM	Engineer 2 advised MBRC Wivenhoe gate operations will be delayed to Saturday morning. This is due to higher than expected inflows from Lockyer.	Correspondence	Flood Officer 7
	1:45 PM	Engineer 2 advised ICC Wivenhoe's gate operations will be delayed till Saturday morning. This is due to higher than expected inflows from Lockyer.	Correspondence	Flood Officer 7
	1:46 PM	Engineer 2 left message for BCC to return his call.	Correspondence	Flood Officer 7
	1:47 PM	Engineer 2 left message for BCC to return his call.	Correspondence	Flood Officer 7
	2:41 PM	MBRC asked for Engineer 2's mobile. He wanted to share MBRC's text message informing people living downstream from North Pine Dam.	Correspondence	Flood Officer 7
	2:45 PM	BCC called for situation update. Engineer 2 provided an update.	Correspondence	Flood Officer 7
	3:00 PM	SDWD Model Updated - SDWD-201101061500.xls	Model Run	Flood Officer 9
	3:11 PM	BoM called to discuss with Engineer 2 about readings from Upper Brisbane & Lockyer. They are in agreement on readings.	Correspondence	Flood Officer 7
	3:19 PM	MBRC called. Engineer 2 advised her North Pine Dam will commence gates operations from 19:00 hrs.	Correspondence	Flood Officer 7
	4:00 PM	SDWD Model Updated - SDWD-201101061600.xls	Model Run	Flood Officer 9
	4:00 PM	NPD model updated - NPD-201101061600.xls	Model Run	
	5:33 PM	Situation Report – 18:00 on Thursday 6 January 2011	Situation Report	Engineer 2
	6:57 PM	North Pine Dam Operator called to inform that MBRC workmen were waiting until 19:00 hrs to close Young's Crossing boom gates. This delayed dam gate opening by 15 minutes.	Correspondence	Flood Officer 1
	7:45 PM	Somerset Dam called to enquire about the release strategy. Engineer 1 advised the impacts of the Lockyer flow were being monitored. Communication by e-mail was O.K.'ed.	Correspondence	Flood Officer 1
	9:00 PM	NPD model updated - NPD-201101062100.xls	Model Run	
	9:00 PM	SDWD Model Updated - SDWD-201101062100.xls	Model Run	Flood Officer 9

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	6:07 AM	Situation Report - 06:00 on Friday 7 January 2011	Situation Report	Engineer 1
Friday 7 January 2011	7:00 AM	Engineer 2 and Flood Officer 8 commenced day shift.	Other	Flood Officer 8
	8:00 AM	NPD model updated - NPD-201101070800.xls	Model Run	
	8:00 AM	Advice from BoM indicates that SEQ can expect some high rainfall totals over the next 5 days up to Tuesday 11/1/11 with the largest falls predicted for Sunday and Monday.	Correspondence	Flood Officer 8
	8:05 AM	Situation Report - 08:00 on Friday 7 January 2011	Situation Report	Engineer 2
	8:21 AM	Called Somerset Council to inform him that the Lockyer is running - all bridges in Somerset Region will be cut off this morning. Wivenhoe gates will be opened once the Lockyer peak is through.	Correspondence	Flood Officer 8
	8:30 AM	Flood Officer 7 spoke with Dam Operator 9 (Stand-in Central Coordinator) about readiness of staff for flood operations. Graham confirms that staff have been rostered and are ready.	Correspondence	Flood Officer 7
	8:40 AM	FOC called MBRC to inform them that North Pine will be operate for the next few days - probably till Tuesday.	Correspondence	Flood Officer 8
	8:44 AM	Called BCC to inform that Wivenhoe gates will be opened again this afternoon and releases might peak at 1500m ³ /s. This might continue until the end of next week.	Correspondence	Flood Officer 8
	8:47 AM	Called ICC to inform him that Wivenhoe gates will be opened again this afternoon and releases might peak at 1500m ³ /s. This might continue until the end of next week.	Correspondence	Flood Officer 8
	8:50 AM	Moreton Bay Regional Council (MBRC) called to query about flows at Fernvale bridge. Engineer 2 provided an update for possible gate operations.	Correspondence	Flood Officer 7
	9:05 AM	NPD Operator called to inform that North Pine Dam staff have been rostered and are ready.	Correspondence	Flood Officer 7
	9:40 AM	Dam Operations Manager called to inform that Ipswich City Council (ICC) has returned to the office and is contactable. He also requested for a situation update.	Correspondence	Flood Officer 7
	10:12 AM	Called BCC to provide situation report.	Correspondence	Flood Officer 8
	11:00 AM	ICC called for a situation update. Engineer 2 shared the release strategy for tonight.	Correspondence	Flood Officer 7
	11:49 AM	Engineer 2 advised MBRC Call Centre that North Pine Dam will commence gate operations tonight. He requested for MBRC to call him.	Correspondence	Flood Officer 7
	12:00 PM	NPD model updated - NPD-201101071200.xls	Model Run	Flood Officer 9
12:00 PM	SDWD Model Updated - SDWD-201101071200.xls	Model Run	Flood Officer 9	
12:04 PM	MBRC called. Engineer 2 advised her that the latest North Pine Dam gates may be opened will be 7:00pm today. FOC will advise them accordingly.	Correspondence	Flood Officer 7	
12:43 PM	MBRC called. Engineer 2 advised that water will be over Savages Crossing until end of the week.	Correspondence	Flood Officer 7	

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	12:46 PM	Engineer 2 advised Brisbane City Council (BCC) Wivenhoe Dam will commence gate operations later today.	Correspondence	Flood Officer 7
	1:32 PM	Engineer 2 left message for Somerset Regional Council (SRC) to return his call.	Correspondence	Flood Officer 7
	1:35 PM	Engineer 2 advised MBRC Wivenhoe gate operations will be delayed to Saturday morning. This is due to higher than expected inflows from Lockyer.	Correspondence	Flood Officer 7
	1:45 PM	Engineer 2 advised ICC Wivenhoe's gate operations will be delayed till Saturday morning. This is due to higher than expected inflows from Lockyer.	Correspondence	Flood Officer 7
	1:46 PM	Engineer 2 left message for BCC to return his call.	Correspondence	Flood Officer 7
	1:47 PM	Engineer 2 left message for BCC to return his call.	Correspondence	Flood Officer 7
	2:41 PM	MBRC asked for Engineer 2 mobile. He wanted to share MBRC's text message informing people living downstream from North Pine Dam.	Correspondence	Flood Officer 7
	2:45 PM	BCC called for situation update. Engineer 2 provided an update.	Correspondence	Flood Officer 7
	3:00 PM	SDWD Model Updated - SDWD-201101061500.xls	Model Run	Flood Officer 9
	3:02 PM	BCC called FOC with concerns that dam release will add another 200mm on top of abnormal high tide. Engineer 2 spoke to BoM who advised that the effect could be around 50mm - if that can be measured.	Correspondence	Flood Officer 8
	3:11 PM	BoM called to discuss with Engineer 2 about readings from Upper Brisbane & Lockyer. BoM & Engineer 2 are in agreement on readings.	Correspondence	Flood Officer 7
	3:19 PM	MBRC called. Engineer 2 advised her North Pine Dam will commence gates operations from 19:00 hrs.	Correspondence	Flood Officer 7
	4:00 PM	SDWD Model Updated - SDWD-201101061600.xls	Model Run	Flood Officer 9
	4:00 PM	NPD model updated - NPD-201101061600.xls	Model Run	
	5:57 PM	Situation Report – 18:00 on Friday 7 January 2011	Situation Report	Engineer 2
	6:00 PM	SDWD Model Updated - SDWD-201101071800.xls	Model Run	Flood Officer 9
	6:57 PM	North Pine Dam Operator called to inform that MBRC workmen were waiting until 19:00 hrs to close Young's Crossing boom gates. This delayed dam gate opening by 15 minutes.	Correspondence	Flood Officer 1
	7:45 PM	Dam Operator 4 (Somerset Dam) called to enquire about the release strategy. Engineer 1 advised the impacts of the Lockyer flow were being monitored. Communication by e-mail was O.K.	Correspondence	Flood Officer 1
	9:00 PM	NPD model updated - NPD-201101062100.xls	Model Run	
	9:00 PM	SDWD Model Updated - SDWD-201101062100.xls	Model Run	Flood Officer 9
Saturday 8	6:32 AM	Situation Report – 06:00 on Saturday 8 January 2011	Situation Report	Engineer 4

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	4:27 PM	BCC returned phone call. BCC was advised by Engineer 2 that the current strategy was to maintain a flow in the Brisbane River such that the Fernvale Bridge and the Mount Crosby Bridge could be kept open. However, future rainfall could well impact on those roads remaining open. Closure next Tuesday is a real possibility at this stage. Flow in the Lower Brisbane potentially might reach 3,000 cumecs by next Wednesday or Thursday.	Correspondence	Flood Officer 1
	5:18 PM	Flood Officer 1 left a message with Dam Operator 9 (A/Co-ord) regarding the potential for Fernvale Bridge and Mount Crosby Bridge to be closed, possibly from Tuesday. This may impact on staffing issues for both Wivenhoe and Somerset Dams during this flood event. Request for Dam Operator 9 to contact the FOC ASAP.	Correspondence	Flood Officer 1
	5:25 PM	BCC returned call to Engineer 2. Engineer 2 advised potential for releasing up to 2,500 cumecs by Tuesday. With further heavy rainfall, as forecast, the flow in the Lower Brisbane could increase to 3,000 cumecs with potential for closure of Fernvale Bridge and Mount Crosby Bridge by Thursday (possibly Wednesday). Releases from Wivenhoe are dependant on flows from Lockyer Ck and inflow into Wivenhoe. FOC will continue to update BCC.	Correspondence	Flood Officer 1
	5:32 PM	NPD Operator phoned the FOC with a manual reading of EL 20.660 at Lake Kurwongbah. He noted that should NPD gates be closed in the near future, the Lake Kurwongbah tailwater would impact on Youngs Crossing.	Correspondence	Flood Officer 1
	5:40 PM	Dam Operations Manager phoned Engineer 2 for an update on the current situation.	Correspondence	Flood Officer 1
	5:45 PM	Dam Operator 9 returned call and Flood Officer 1 advised that Engineer 2 had requested Dam Operator 9 to factor into his staffing roster of Wivenhoe and Somerset Dams the potential for the Fernvale bridge and the Mount Crosby Bridge to be closed from mid-week sometime, depending on the likelihood of further heavy rainfall.	Correspondence	Flood Officer 1
	5:51 PM	Situation Report – 17:00 on Sunday 9 January 2011	Situation Report	Engineer 1
	5:58 PM	Engineer 2 called BoM to discuss Wivenhoe Dam's release strategy i.e. Major bridge open strategy Vs increased inflow into Wivenhoe resulting from current heavy rainfall. Situation will become clearer in 24 hours time.	Correspondence	Flood Officer 1
	6:00 PM	SDWD Model Updated - SDWD-201101091800.xls	Model Run	Flood Officer 9
	6:00 PM	NPD model updated - NPD-201101091800.xls	Model Run	Flood Officer 9
	6:35 PM	The caretaker from the house at the Colleges Crossing Reserve rang FOC to enquire about predicted flood height at the Colleges Crossing Bridge. Engineer 2 referred him to ICC for an update on flood information affecting the Ipswich area. Advised no change in Wivenhoe releases at this stage and the future options were presently unknown.	Correspondence	Flood Officer 1
	7:00 PM	SDWD Model Updated - SDWD-201101091900.xls, SDWD-201101091900norain.xls, SDWD-201101091900withrain.xls	Model Run	Flood Officer 9
	7:10 PM	FOC called SRC advising him that high releases from Wivenhoe (3000 cumecs) are expected to be necessary in view of heavy rain over the last 3 hours.	Correspondence	Flood Officer 6
	7:15 PM	FOC called Seqwater CEO advising him that high rainfall is expected overnight and releases from Wivenhoe causing damaging flooding are likely to be necessary.	Correspondence	Flood Officer 6

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	7:15 PM	FOC called Director Dam Safety advising him that FOC is now looking at much larger flows and will have to ramp up releases to around 3000 cumecs as by as early as midnight which is likely to have flooding impacts on low-lying areas of Brisbane.	Correspondence	Flood Officer 6
	7:20 PM	Engineer 2 called BCC advising him of potential for high releases sooner than previously expected.	Correspondence	Flood Officer 6
	7:25 PM	NPD Operator called to advise dam level is at 39.82m AHD, 3 gates are at increment 2 and two are at increment 1. The two at increment 1 are currently being raised to increment 2 (next few minutes).	Correspondence	Flood Officer 6
	8:00 PM	SDWD Model Updated - SDWD-201101092000withnorain.xls	Model Run	Flood Officer 9
	8:05 PM	Engineer 1 called NPD Operator to confirm last directive is completed. All gates at increment 2.	Correspondence	Flood Officer 6
	8:30 PM	ICC returned call and spoke to Engineer 3. He was informed of current situation and the likelihood of high releases tomorrow causing flood damage.	Correspondence	Flood Officer 6
	8:50 PM	Engineer 1 called BCC to request copy of flood damages curve from 2007 study. BCC will send a copy tomorrow.	Correspondence	Engineer 1
	8:55 PM	BCC called back and spoke with Engineer 3. Confirmed BCC mobilisation triggers need to be in place. Status report is in preparation and will be emailed out shortly.	Correspondence	Flood Officer 6
	9:10 PM	Dam Operations Manager called and spoke with Engineer 1. Dam Operations Manager confirmed that releases will need to be ramped up from current 1400 cumecs to 2500 cumecs which will cause flooding in low lying areas of Brisbane. Brisbane flood information centre has not yet been mobilised. Somerset RC has no DTMR A/H contacts and will be contacting them in the morning. Dam Operations Manager will locate DTMR contacts. Confirmed volumes getting close to 1974 levels. Confirmed situation report has gone out.	Correspondence	Flood Officer 6
	9:15 PM	BoM called and spoke with Engineer 2. They discussed on rainfall expectations and flood warning requirements for Brisbane. Bremer/Warrill situation being monitored. Actual and projected flows sent to BoM.	Correspondence	Flood Officer 6
	9:20 PM	ICC spoke with Engineer 1. Emailing DTMR A/H contact to flood room. Kiosk caretaker at Colleges Crossing is being evacuated.	Correspondence	Flood Officer 6
	10:00 PM	SDWD Model Updated - SDWD-201101092200withnorain.xls, SDWD-201101092200-Forecast24hr.xls	Model Run	Flood Officer 9
	10:00 PM	NPD model updated - NPD-201101092200.xls	Model Run	Flood Officer 9
	10:00 PM	Engineer 3 called Wivenhoe operator (Dam Operator 7) and confirmed current flooding expectations based on rainfall predictions and expected impacts.	Correspondence	Flood Officer 6
	10:15 PM	FOC called SRC. A situation update was provided. Fernvale Bridge closure likely to be required in view of probable releases from Somerset to Wivenhoe.	Correspondence	Flood Officer 6
	10:20 PM	Dam Operations Manager called and spoke with Engineer 1. A teleconference with Water Grid Manager and DERM was completed. Explained 9:00pm situation report. Water Grid Manager will be distributing media release in the morning regarding closure of bridges.	Correspondence	Flood Officer 6

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	10:30 PM	Mt Crosby WTP Manager called and spoke with Engineer 1. He was concerned the guardrails need to be taken off bridge before bridge goes over. Engineer 1 recommended getting the rails straight off in view of increasing flow expectations overnight. Flow expected to get to 2000ML by morning.	Correspondence	Flood Officer 6
	10:30 PM	Engineer 3 called Wivenhoe Dam operator (Dam Operator 7) requesting for a visual inspection of Fernvale Bridge.	Correspondence	Flood Officer 6
	10:40 PM	Dam Operator 7 (Wivenhoe Dam) called discussed Fernvale Bridge situation with Engineer 3. Water was lapping the bridge girders.	Correspondence	Flood Officer 6
	10:45 PM	Dam Operations Manager called and spoke with Engineer 1. Dam Operations Manager will be contacting Dan Spiller to confirm closure of Mt Crosby Weir Bridge. Police are on site.	Correspondence	Flood Officer 6
	11:20 PM	Engineer 3 called ICC and left message regarding rates of rise at Mt Crosby. Bridge will be inundated within the next couple of hours.	Correspondence	Flood Officer 6
	11:25 PM	Engineer 3 called ICC regarding rates of rise at Mt Crosby (approx 200mm from going over) - will be inundated within the next couple of hours. Confirmed more rain is on the way and releases will need to be increased.	Correspondence	Flood Officer 6
	11:25 PM	Engineer 1 spoke with Dam Operator 7 (Wivenhoe Dam). Water is up to the centreline of the Chine Gully approach to Fernvale Bridge. Esk Police are on site and are considering placing road closure signs in Fernvale. Dam operators living in Fernvale will be mobilised to the dam by Police prior to closure.	Correspondence	Flood Officer 6
	11:30 PM	Engineer 3 called SRC and left message advising of situation.	Correspondence	Flood Officer 6
	11:35 PM	Engineer 1 called DTMR and left message regarding current road closure situation.	Correspondence	Flood Officer 6
	11:35 PM	Engineer 3 called SRC and left message for call to be returned re Fernvale Bridge situation.	Correspondence	Flood Officer 6
	11:38 PM	Engineer 3 called SRC CEO and left message regarding Fernvale Bridge situation and requested call be returned ASAP.	Correspondence	Flood Officer 6
	11:40 PM	SRC called back and spoke with Engineer 3. Engineer 3 confirmed the high flow levels and anticipated further level rises will impacts road crossings. Fernvale Bridge was about to go out. Informed of the levels and inflows to Wivenhoe and Somerset and the expectation for more rain.	Correspondence	Flood Officer 6
Monday 10 January 2011	12:00 AM	SRC called again and spoke with Engineer 3. Engineer 3 confirmed Police were on site at Fernvale Bridge and were contemplating road closure signs at Fernvale. Confirmed message has been left with DTMR but call not yet returned.	Correspondence	Flood Officer 6
	12:15 AM	Mt Crosby WTP Manager called to confirm Mt Crosby Weir road is closed (call taken by Flood Officer 6). Confirmed that ICC has been notified and message left with DTMR.	Correspondence	Flood Officer 6
	12:45 AM	BCC called and spoke with Engineer 3. Indicated that 3500 cumecs is the damaging flow level for Brisbane urban areas. The manual documents 4000 cumecs as the damaging level. Engineer 3 undertook to take this into consideration when preparing the current situation report, and would not refer to damage levels.	Correspondence	Flood Officer 6

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	12:55 AM	Engineer 3 called Dam Operations Manager to discuss BCC's view on damaging flow. Engineer 3 confirmed that if flows were kept below 3500 the fuse plug would be triggered. Agreed that situation reports will not allude to damage levels - the councils can make decisions on what to report in this regard.	Correspondence	Flood Officer 6
	1:00 AM	SDWD Model Updated - SDWD-201101100100withnorain.xls	Model Run	Flood Officer 9
	1:00 AM	Engineer 1 called Dam Operator 1 (Somerset Dam) regarding purported dam stability issues (via ICC - two reports received). Dam Operator 1 confirmed that inspection had revealed no issues.	Correspondence	Flood Officer 6
	3:00 AM	SDWD Model Updated - SDWD-201101100300withnorain.xls	Model Run	Flood Officer 9
	3:00 AM	NPD model updated - NPD-201101100300.xls	Model Run	Flood Officer 9
	4:10 AM	Engineer 3 discussed Wivenhoe status and release strategy with Dam Operator 7.	Correspondence	Flood Officer 6
	5:00 AM	SDWD Model Updated - SDWD-201101100500withnorain.xls	Model Run	Flood Officer 9
	5:00 AM	Dam Operator 4 called and discussed Somerset situation with Engineer 1.	Correspondence	Flood Officer 6
	5:00 AM	NPD model updated - NPD-201101100500.xls	Model Run	Flood Officer 9
	5:05 AM	Dam Operations Manager called and received situation update from Engineer 3.	Correspondence	Flood Officer 6
	5:20 AM	Engineer 1 called BoM regarding next forecast updates due at 9:00 am.	Correspondence	Flood Officer 6
	6:00 AM	Send out situation report for this morning.	Correspondence	Flood Officer 8
	7:40 AM	Talked to BoM - we are in general agreement about current flows in the Brisbane River.	Correspondence	Flood Officer 8
	8:30 AM	FOC left a message for BCC to call back.	Correspondence	Flood Officer 8
	8:38 AM	Talked to BoM to discuss our planned strategy i.e. to maintain gate openings for the next 24 hrs. This increases flood storage by 75 000ML which is equivalent to 0.2m rise and limits flows in the Brisbane to 3 000 m ³ /s this provides a buffer for potential runoff for the next 24 hrs.	Correspondence	Flood Officer 8
	9:38 AM	Conference call with BCC - informed them that release from Wivenhoe will be maintained at 2000m ³ /s for the next 24 hrs. This will be revised in 24 hrs. The strategy is to limit the flows to 3000 - 3500m ³ /s. At 3500m ³ /s about 322 (the whole property) will be submerged and about 7000 properties will be affected somehow damage bill \$7mil). If the rainfall in the Bremer and Lockyer increases substantially - it is likely the flows from these catchments can peak at 1000m ³ /s (on top of Wivenhoe release)	Correspondence	Flood Officer 8
	10:08 AM	Received QPF - 100mm in Brisbane and 150mm North Pine catchment	Other	Flood Officer 8
	10:15 AM	Received phone call from EMQ and Logan/Scenic Rim District Disaster Coordinator - gave them the same information as what we gave BCC before.	Correspondence	Flood Officer 8
	10:46 AM	BoM to inform that Engineer 2 can do the model and with 600m ³ /s in the Bremmer the flows in Brisbane will go up to 3600m ³ /s. BoM will discuss with BCC.	Correspondence	Flood Officer 8

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	11:14 AM	ICC called to clarify our strategy. Gave him the same info as above.	Correspondence	Flood Officer 8
	1:00 PM	SDWD Model Updated - SDWD-201101101300withnorain.xls	Model Run	Flood Officer 9
	12:02 PM	Spoke with Seqwater CEO to answer elaborate on Situation Report and inform him of large rainfalls currently occurring in the Wivenhoe catchment.	Correspondence	Flood Officer 8
	12:33 PM	Called BCC twice. No answer, left messages.	Correspondence	Flood Officer 8
	12:36 PM	Spoke with ICC, informed them that we are moving strategy from urban damage control to dam safety priority	Correspondence	Flood Officer 8
	12:41 PM	NPD operator called to inform FOC the level is dropping. Instructed them not to close gates - heavy rain fell in catchment.	Correspondence	Flood Officer 8
	2:00 PM	Send out third situation report for today.	Correspondence	Flood Officer 8
	2:30 PM	Called BCC 3 times before getting through to Flood Information Centre (FIC). Discussed latest strategy with them i.e. changing from "Flood Mitigation" to "Dam Safety". We will start opening Wivenhoe gates from 15:00.	Correspondence	Flood Officer 8
	3:00 PM	Called Disaster Coordinator. No answer.	Correspondence	Flood Officer 8
	4:00 PM	NPD model updated - NPD-201101101600.xls	Model Run	Flood Officer 9
	3:15 PM	Had conference call with BoM. They agree with FCC on model discharge results. However, BoM included 6hrs of additional rain which takes the discharge to 4600m3/s	Correspondence	Flood Officer 8
	4:09 PM	Engineer 2 spoke to a Police Officer about Cressbrook Dam - advising that FOC does not manage Cressbrook but gave him a contact at Toowoomba RC	Correspondence	Flood Officer 8
	5:00 PM	SDWD Model Updated - SDWD-201101101700withnorain.xls, SDWD-201101101700with50mmrain.xls	Model Run	Flood Officer 9
	5:09 PM	Dam Operator 2 phoned and reported water from Wivenhoe in getting into the hydro	Correspondence	Flood Officer 8
	6:06 PM	Get weather update from BoM - the forecast now is - still more of the same of what we had today.	Other	Flood Officer 8
	6:45 PM	North Pine Dam operator raised concerns with school groups using Lake Kurwongbah for rowing exercise while water is running over the spillway at 500mm. He was referred to Rangers.	Correspondence	Flood Officer 8
	7:30 PM	Dam Operator 2 (Somerset) called to inform that Somerset hydro is inundated with water. He believes he has located source of leak, has tightened seals to prevent further leakage. He also noted that there is oil in the water.	Correspondence	Flood Officer 9
	8:00 PM	SDWD Model Updated - SDWD-201101102000withnorain.xls, SDWD-201101102000-Lockyer.xls, SDWD-201101102000-TMinflows.xls	Model Run	Flood Officer 9
	20:00 PM	BoM called to advise of situation regarding flows in Lockyer. Estimated very heavy localised rainfall (e.g. 600mm in few hours) on Toowoomba escarpment to cause observed flood flooding. Will monitor via Glenore Grove gauging station.	Correspondence	Flood Officer 9

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	20:45 PM	Seqwater Mt Crosby WTP Manager called to get situation update. Advised that at 20m there will be issues at Mt Crosby WTP. FOC to advise WTP Manager if likely to reach that level.	Correspondence	Flood Officer 9
	21:00 PM	Spoke to Director Dam Safety regarding strategies for reducing Wivenhoe release to mitigate latest event in Lockyer. He endorsed variation to manual to operate at minimum gate settings to create gap to allow peak of flash flood to pass. Also endorsed concept allowing Wivenhoe HW to rise above 74 mAHD briefly.	Correspondence	Flood Officer 9
	21:30 PM	Provided ICC with situation update.	Correspondence	Flood Officer 9
	20:20 PM	Spoke to BoM regarding reducing Wivenhoe release to accommodate peak of Lockyer flash flood.	Correspondence	Flood Officer 9
	11:20 PM	Spoke to Dam Operations Manager to give situation update. He agreed that if possible to reduce flow from Wivenhoe to accommodate Lockyer flash flood peak.	Correspondence	Flood Officer 9
Tuesday 11 January 2011	12:00 AM	SDWD Model Updated - SDWD-201101110000withnorain.xls	Model Run	Flood Officer 9
	12:00 AM	NPD model updated - NPD-201101110000.xls	Model Run	Flood Officer 9
	12:15 AM	Spoke to BCC to update on current release strategy.	Correspondence	Flood Officer 9
	1:30 AM	Spoke to SRC. Somerset Regional Council offices were flooded and email addresses are no longer working. Tony can be emailed on an alternative email address, which has been recorded.	Correspondence	Flood Officer 9
	2:15 AM	BCC called to confirm forecast peak height of 3.1m at Brisbane city gauge for Wednesday high tide. This is based on 4600 cumecs modelled by BoM. Provided James with update on current release strategy.	Correspondence	Flood Officer 9
	3:00 AM	SDWD Model Updated - SDWD-201101110300withnorain.xls	Model Run	Flood Officer 9
	3:15 AM	BCC has provided inundation forecast for Brisbane city to assist with devising strategy to manage Wivenhoe releases	Correspondence	Flood Officer 9
	5:15 AM	Spoke to BoM regarding reducing Wivenhoe release to accommodate peak of Lockyer flash flood. Update: Consensus was that reducing release from Wivenhoe would no longer be feasible due to attenuation of Lockyer peak and significant additional rainfall in upper Brisbane during the night.	Correspondence	Flood Officer 9
	7:00 AM	SDWD Model Updated - SDWD-201101110700withnorain.xls	Model Run	Flood Officer 9
	7:00 AM	NPD model updated - NPD-201101110700.xls	Model Run	Flood Officer 9
	7:20 AM	Engineer 2 called Seqwater CEO to appraise of latest situation of Wivenhoe and lower Brisbane	Correspondence	Flood Officer 4
	7:22 AM	Engineer 2 called BoM to appraise of situation. BoM unable to talk and will call back.	Correspondence	Flood Officer 4
7:35 AM	BoM called back. Full appraisal of Seqwater strategy. Both Seqwater and BoM models results were discussed in detail, and generally agreed with each other.	Correspondence	Flood Officer 4	
7:51 AM	Called Dam Operator 10 (Wivenhoe Dam) advised that gates opening at Wivenhoe are imminent.	Correspondence	Flood Officer 4	

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	7:56 AM	Engineer 2 called BoM. Advised BoM that Wivenhoe will ramp up to a minimum release of 3700m3/s.	Correspondence	Flood Officer 4
	7:59 AM	Engineer 4 called Seqwater CEO and advised that releases from Wivenhoe will reach 3700m3/s at a minimum, and BoM has been informed. Likely to affect Moggill 24 hours later. Phone call terminated due to bad connection.	Correspondence	Flood Officer 4
	8:01 AM	Seqwater CEO returned call. Engineer 4 advised that model to be run for BoM first and results to be past to BoM and BCC immediately. Rain likely to continue today	Correspondence	Flood Officer 4
	8:05 AM	NPD Operator informed that levels are still rising and another directive is required. Engineer 4 advised to proceed as per operations manual.	Correspondence	Flood Officer 4
	8:09 AM	Advised Dam Operator 10 (Wivenhoe Dam) that Wivenhoe Directive was coming through in a matter of minutes.	Correspondence	Flood Officer 4
	8:10 AM	Engineer 4 called Director Dam Safety to advise of current Wivenhoe situation. Will exceed EL74m. Ramping up gate opening to a minimum of 3700 and gate operations will progress.	Correspondence	Flood Officer 4
	8:11 AM	Engineer 2 called BCC flood information centre (Duty Officer). Wivenhoe releases will reach 3700m3/s at a minimum and higher flows are possible.	Correspondence	Flood Officer 4
	8:15 AM	Engineer 4 called Dam Operations Manager to advise of the situation that Wivenhoe will increase to 3700m3/s as a minimum.	Correspondence	Flood Officer 4
	8:16 AM	Engineer 2 called SRC and left a message.	Correspondence	Flood Officer 4
	8:20 AM	Engineer 4 Called Dam Operator 10 (Wivenhoe Dam) and advised more gate opening directives are coming.	Correspondence	Flood Officer 4
	8:21 AM	Engineer 2 called ICC to advise of situation and that Wivenhoe releases to be at a minimum of 3700m3/s	Correspondence	Flood Officer 4
	8:25 AM	Engineer 4 called North Pine Dam operator. Verbal directive to open gates, faxed directive to follow before 9am.	Correspondence	Flood Officer 4
	8:50 AM	Seqwater CEO called Engineer 2 mobile requesting 'worst case' scenario	Correspondence	Flood Officer 4
	8:50 AM	Dam Operator 7 from Wivenhoe called informing that Wivenhoe has lost power, high voltage fuse blown. Hydro outlet is shut off.	Correspondence	Flood Officer 4
	9:09 AM	Engineer 4 called Seqwater Tactical Maintenance Planner, advised that Wivenhoe has lost power, possibly blown high voltage fuses. Maintenance Planner to resolve issue.	Correspondence	Flood Officer 4
	9:12 AM	NPD Operator called NPD at 40.140 m HAD all gates at 6, currently heading to setting 7.	Correspondence	Flood Officer 4
	9:13 AM	Energex called. All incoming power has been lost at Wivenhoe.	Correspondence	Flood Officer 4
	9:16 AM	Engineer 4 called MBRC and left message: very large inflows into North Pine Dam has resulted in steep gate openings. Flood downstream can be expected.	Correspondence	Flood Officer 4
	9:17 AM	Engineer 4 called MBRC and informed that very large inflows into North Pine Dam have resulted in steep gate openings. Flood downstream can be expected. Strathpine Rd (Old Gympie Rd) to be flooded within next hour.	Correspondence	Flood Officer 4

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	9:21 AM	Dam Operator 2 from Somerset called Engineer 2. Water ingress through doors at the bottom of dam	Correspondence	Flood Officer 4
	9:22 AM	Engineer 4 advised NPD Operator that Strathpine Rd is expected to be closed.	Correspondence	Flood Officer 4
	9:26 AM	Engineer 4 advised NPD Operator verbally that all gates can go to 9 increments based on water level as per manual.	Correspondence	Flood Officer 4
	9:40 AM	Engineer 2 called Flood Officer 7 and requested a technically knowledgeable person be dispatched to test HF radio links and satellite phone are in working condition	Correspondence	Flood Officer 4
	9:51 AM	Voicemail: Tactical Maintenance Planner left message. He's contacted Energex and Energex suspect a dirty feed. Currently all helicopters are grounded. Specialist Trade Technician is lead at Mt Crosby. Energex will get as close as they can and get helicopter lift when possible.	Correspondence	Flood Officer 4
	10:00 AM	NPD model updated - NPD-201101111000.xls	Model Run	Flood Officer 9
	10:25 AM	North Pine Dam Operator called to report Lake level at EL 40.490m AHD. All gates currently at setting No. 10.	Correspondence	Flood Officer 4
	10:29 AM	Seqwater called Engineer 2, in conference with Principal Dams and Weirs Planning. Internal questioning of release strategy. Internal discussion regarding current approved strategy.	Correspondence	Flood Officer 4
	10:45 AM	Engineer 4 advised MBRC of current situation.	Correspondence	Flood Officer 4
	10:54 AM	Dam Operations Manager called. Bad line and disconnected.	Correspondence	Flood Officer 4
	11:00 AM	SDWD Model Updated - SDWD-201101111100withmorain.xls	Model Run	Flood Officer 9
	11:01 AM	Message received by Engineer 4. Kilcoy Police rang Somerset, Engineer 4 advised general status information to be provided by dam operators, predictions to go through FOC.	Correspondence	Flood Officer 4
	11:02 AM	Seqwater CEO requested update on situation.	Correspondence	Flood Officer 4
	11:04 AM	Engineer 4 called Dam Operator 7. Discussed that if forecast rain falls, fuse plug likely to go.	Correspondence	Flood Officer 4
	11:06 AM	FAX not working at Wivenhoe!	Other	Flood Officer 4
	11:07 AM	BoM called. Inflow into NPD of 1500cumecs. Advised Wivenhoe strategy to be revised.	Correspondence	Flood Officer 4
	11:17 AM	Principal Dams and Weirs Planning called Engineer 2 - on the way to talk to Grid Manager. Engineer 2 advised current strategy is 3 hourly.	Correspondence	Flood Officer 4
	11:19 AM	Engineer 4 called MBRC. Advised North Pine still rising. Current releases to exceed 2000cumecs.	Correspondence	Flood Officer 4
	11:30 AM	North Pine Dam operator called to report lake level EL 40.740 m AHD. Water level rising slowly. All gates now at setting 14.	Correspondence	Flood Officer 4
	11:38 AM	Engineer 2 called BoM. Unable to contact BoM. Will call back.	Correspondence	Flood Officer 4

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	11:38 AM	Engineer 4 called Seqwater CEO and advised that releases at Wivenhoe will be ramped up to 4000cumecs and strategy will be revised on an hourly basis. In reality releasing slightly less than the Flood Ops manual.	Correspondence	Flood Officer 4
	11:51 AM	Incoming Phone call from Engineer 1. Advised SS that Wivenhoe will ramp up to 4000cumecs. Also advised that staff likely to stay in offices overnight.	Correspondence	Flood Officer 4
	11:56 AM	Engineer 4 called MBRC and left message again. Outflow will exceed 2000cumecs	Correspondence	Flood Officer 4
	11:57 AM	Engineer 4 called MBRC. Left message: North Pine Dam outflow likely to exceed 2000cumecs.	Correspondence	Flood Officer 4
	11:59 AM	Engineer 4 called MBRC. Left message, outflow from North Pine Dam will exceed 2000cumecs.	Correspondence	Flood Officer 4
	12:04 PM	North Pine Dam Operator called to report lake level at EL 40.883 mAHD. Gates are currently set at setting 16.	Correspondence	Flood Officer 4
	12:10 PM	Flood Officer 2 called from FOC satellite phone. Made contact with Somerset and North Pine. Connection issues with Landline to Wivenhoe.	Correspondence	Flood Officer 4
	12:17 PM	MBRC called. Engineer 2 advised discharge in excess of 1989 flood (1500cumecs). Current releases in excess of 2000cumecs.	Correspondence	Flood Officer 4
	12:30 PM	North Pine Dam Operator called to report lake level is now at EL 40.950mAHD and rising. Gate settings at 17.	Correspondence	Flood Officer 4
	12:42 PM	Redlands Shire Council called requesting information for Lesley Harrison. Was told to call Operations Coordinator South.	Correspondence	Flood Officer 4
	12:42 PM	Call from Mary Valley Lead Operator. Asked what is required of the Northern dams. Was advised to monitor dams more closely when/if 1 in 50 year event occurs.	Correspondence	Flood Officer 4
	1:02 PM	North Pine Dam Operator called to report Lake level EL 41.040 m AHD. Gate settings at setting 18.	Correspondence	Flood Officer 4
	1:26 PM	Seqwater CEO called and requested the FOC request the BoM to consider if Wivenhoe is releasing 9000cumecs.	Correspondence	Flood Officer 4
	1:44 PM	North Pine Dam called on Satellite phone to confirm it is operational.	Correspondence	Flood Officer 4
	1:50 PM	North Pine Dam Operator called to report lake level at EL 41.105mAHD. Gates currently at setting 19.	Correspondence	Flood Officer 4
	1:56 PM	Dam Operations Manager requesting status update.	Correspondence	Flood Officer 4
	2:00 PM	SDWD Model Updated - SDWD-201101111400withnorain.xls	Model Run	Flood Officer 9
	2:24 PM	Seqwater Wivenhoe Admin Officer called to pass on message. QLD Fire Rescue called to enquire about Wivenhoe Releases. Unable to call at this stage.	Correspondence	Flood Officer 4
	2:37 PM	Seqwater CEO called to discuss current situation.	Correspondence	Flood Officer 4
	2:46 PM	North Pine Dam Operator called to report lake level steady at 41.110 for last 30 minutes.	Correspondence	Flood Officer 4
	2:53 PM	North Pine Dam is isolated as per conversation with operator.	Correspondence	Flood Officer 4

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	3:00 PM	NPD model updated - NPD-20110111500.xls	Model Run	Flood Officer 9
	3:06 PM	Manager WTP Operations North (Seqwater) called to enquire about the current release rate from Wivenhoe Dam.	Correspondence	Flood Officer 4
	3:14 PM	Seqwater CEO called to discuss the proposed release of 10,000cumecs. Engineer 4 and Engineer 2 explained release strategy is constantly being revised.	Correspondence	Flood Officer 4
	3:49 PM	BoM had a conference with Engineer 1, 2, 3 and 4 about current release strategy and possible maximum release scenario of 10000m ³ /s. This would be of a similar magnitude to the 1893 event (~8.36m in Brisbane Port Office)	Correspondence	Flood Officer 4
	3:54 PM	Manager WTP Operations North (Seqwater) called and talked to Engineer 4 regarding current inflow strategy.	Correspondence	Flood Officer 4
	3:58 PM	Called NPD Operator (at Wivenhoe Dam) to check if all is ok, levels are slowly reducing.	Correspondence	Flood Officer 4
	4:29 PM	Lowood Police rang to request water level of Wivenhoe and discuss the current release strategy with respect to the fuse plug (conversed with Flood Officer 9).	Correspondence	Flood Officer 4
	4:33 PM	Phone call with Engineer 2 and Seqwater CEO. Discussed that even though the magnitude flood in Brisbane is similar to 1974 flood event, the no-dam flood would be significantly larger without Wivenhoe.	Correspondence	Flood Officer 4
	4:41 PM	Director Dam Safety phone call. He requested more technical information in the status reports released by Duty Engineers. Director Dam Safety will send through an example of the technical data requested in the report.	Correspondence	Flood Officer 4
	4:46 PM	Principal Incident and Emergency Management (Seqwater) called to request update in inflow/outflow of Wivenhoe Dam.	Correspondence	Flood Officer 4
	5:00 PM	SDWD Model Updated - SDWD-201101111700withnorain.xls	Model Run	Flood Officer 9
	5:12 PM	Engineer 4 called North Pine Dam operator regarding gate operating strategy. Engineer 4 advised to keep gates at current setting until water is clear of the controls. Gate closing strategy then to follow Flood Manual.	Correspondence	Flood Officer 4
	5:22 PM	BoM, Engineer 2 and Engineer 3 discussed current Wivenhoe inflows and anticipated outflows. Engineer 2 confirmed that 7500cumecs is still likely early tonight.	Correspondence	Flood Officer 4
	5:27 PM	North Pine Dam operator called to report of NPD level EL 40.7 m AHD. Engineer 4 verbally advised 10 minute gate closure intervals is ok until 39.9 m AHD - then back to 15 min intervals.	Correspondence	Flood Officer 4
	5:48 PM	Dam Operations Manager asking Tarong Energy to hold off releasing water from Splityard Creek.	Correspondence	Flood Officer 4
	6:00 PM	NPD model updated - NPD-20110111800.xls, NPD-20110111800 Final.xls	Model Run	Flood Officer 9
	6:00 PM	SDWD Model Updated - SDWD-201101111800withnorain.xls	Model Run	Flood Officer 9
	6:04 PM	Mary Valley Lead Operator called to advise he is unable to reach Lake Macdonald to take readings.	Correspondence	Flood Officer 4
	6:07 PM	Recap of current release strategy amongst Duty Engineers. Current Wivenhoe scenario: 74.9 m - all gates at 12m. Won't go to 13m settings until level reaches 75.0 m AHD.	Correspondence	Flood Officer 4

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	6:35 PM	Dam Operator 2 (Somerset Dam) called to confirm all is good.	Correspondence	Flood Officer 4
	6:36 PM	Bill Stevens called to inform team he is cut off due to flood waters and unable to come in.	Correspondence	Flood Officer 4
	6:41 PM	Tarong Energy confirmed releases from Splyard Creek have stopped.	Correspondence	Flood Officer 4
	6:56 PM	Informed that tailwater gauge appears to be OOA. Confirmed by Engineer 2.	Correspondence	Flood Officer 4
	7:00 PM	Spoke to NPD operator who confirmed that North Pine gate settings were at 17, with level of 40.5. Closing sequence was still to close in 10 minute increments down to level 39.9, at which time increments would increase to 15 minutes.	Correspondence	Flood Officer 9
	7:10 PM	NPD Operator rang, is concerned that the level is dropping too fast.	Correspondence	Flood Officer 3
	7:30 PM	Dam Operator 7 (Wivenhoe Dam) called to report that Wivenhoe Level 74.97m AHD is holding.	Correspondence	Flood Officer 3
	7:30 PM	North Pine Dam Operator rang to say he is behind in gate settings.	Correspondence	Flood Officer 3
	7:25 PM	Engineer 3 called North Pine Dam Operator to advise that a directive will be sent to move all gates down to 11m.	Correspondence	Flood Officer 3
	7:45 PM	North Pine Dam Operator called FOC. Engineer 4 clarified directive 19 to drop gates from 16 to 11 in one go, at 15 minutes intervals.	Correspondence	Flood Officer 3
	8:00 PM	BoM rang. Unofficially, Engineer 2 advised that things have stabilised. Also advised predicted peaks at various sites.	Correspondence	Flood Officer 3
	8:25 PM	Tactical Maintenance Planner rang to advise that the high voltage feeder to Wivenhoe will not be restored for the duration of this event. Engineer 4 advised that Wivenhoe is operating successfully on the generator, and they have a fair bit of diesel. There are still 2 other backups to operate the gates.	Correspondence	Flood Officer 3
	8:25 PM	Colliers Building Services rang back. Engineer 1 asked about power supply to 179 Turbot Street. Colliers Building Services said to email our power requirements.	Correspondence	Flood Officer 3
	8:30 PM	Dam Operator 7 (Wivenhoe Dam) called to advise that Wivenhoe's level is 5mm down.	Correspondence	Flood Officer 3
	8:30 PM	Engineer 1 called Colliers Building Services and left a message to call back (regarding loss of power to the 179 Turbot Street)	Correspondence	Flood Officer 3
	8:30 PM	Engineer 1 rang SunWater to advise that power will be shutting down in the CBD tomorrow morning.	Correspondence	Flood Officer 3
	8:35 PM	Engineer 1 rang SunWater to advise the power situation.	Correspondence	Flood Officer 3
	8:35 PM	Seqwater CEO called FOC to speak with all duty engineers on the operating strategies for Wivenhoe releases.	Correspondence	Flood Officer 3
	8:40 PM	Flood Officer 7 called FOC to ensure we received the Energex message regarding power shutdown to the CBD.	Correspondence	Flood Officer 3
	8:45 PM	SunWater rang. Engineer 1 advised that Energex will be cutting power to the CDD in the morning. SunWater will call Mike Minter and the security guys for Mineral House.	Correspondence	Flood Officer 3

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	8:50 PM	North Pine Dam Operator called to report NPD Level at EL 40.07mAHD. Gates are all at 11 increments.	Correspondence	Flood Officer 3
	8:55 PM	Seqwater CEO rang asking about possibly reducing releases. Engineer 2 advised that we are seriously considering it, but this would have little effect on the levels in Brisbane River. CEO would like technical reports every hour throughout the night.	Correspondence	Flood Officer 3
	9:00 PM	Engineer 1 emailed Colliers Building Services with our building power requirements.	Correspondence	Flood Officer 3
	9:05 PM	Engineer 2 rang BoM to advise that power to the CBD may be cut and send him actual and releases report.	Correspondence	Flood Officer 3
	9:10 PM	SunWater called Engineer 1. SunWater advised he spoke to Colliers Building Services and is getting an Energex contact.	Correspondence	Flood Officer 3
	9:20 PM	SunWater rang. Mike Minter told them we may not be able to have air conditioning.	Correspondence	Flood Officer 3
	9:25 PM	Engineer 1 called SunWater. Colliers Building Services got back to him and has Haywoods Electrical lined up for tomorrow morning.	Correspondence	Flood Officer 3
	9:30 PM	North Pine Dam Operator called. They are still behind in gate closures.	Correspondence	Flood Officer 3
	9:35 PM	Engineer 4 rang to discuss the latest directive to raise Wivenhoe Dam. Engineer 4 suggested not raising.	Correspondence	Flood Officer 3
	9:40 PM	Flood Officer 9 called Dam Operator 7 (Wivenhoe Dam) to obtain a current level. EL 74.9? Gates have been raised to 11.5m.	Correspondence	Flood Officer 3
	10:00 PM	SDWD Model Updated - SDWD-201101112200withmorain.xls	Model Run	Flood Officer 9
	10:00 PM	SunWater rang to advise the phone number for Steve from Energex [REDACTED]	Correspondence	Flood Officer 3
	10:00 PM	SunWater rang requesting Engineer 1 mobile number to pass on onto Energex.	Correspondence	Flood Officer 3
	10:30 PM	SunWater rang to say Geoff White has pleaded our case with the CEO of Energex and it is likely 179 Turbot Street will not lose power.	Correspondence	Flood Officer 3
	10:35 PM	Dam Operator 7 (Wivenhoe Dam) called to report lake level of 74.94mAHD @ 10:30hrs.	Correspondence	Flood Officer 3
	11:00 PM	Dam Operator 7 (Wivenhoe Dam) called to report lake level of 74.92mAHD @ 11:00hrs.	Correspondence	Flood Officer 3
	11:10 PM	Dam Operations Manager rang to request discharge from Wivenhoe when the gates are lowered to 10m. Advised 6100m ³ /sec.	Correspondence	Flood Officer 3
	11:30 PM	Flood Officer 9 called Dam Operator 7 (Wivenhoe Dam) to obtain a current level. EL 74.9? Gates have been raised to 11.5m.	Correspondence	Flood Officer 3
Wednesday 12 January 2011	12:30 AM	Dam Operator 7 (Wivenhoe Dam) called to report lake level of 74.88mAHD @ 12:30hrs.	Correspondence	Flood Officer 3
	1:00 AM	SunWater called to provide Energex contact details. Energex indicated that they didn't believe 179 Turbot St would be disconnected from power grid in the morning.	Correspondence	Flood Officer 9

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	1:15 AM	Engineer 1 rang Dam Operator 7 (Wivenhoe Dam) advising next directive. We want to get releases down as quick as possible while still lowering lake levels. Advised that we may possibly have a communications problem in the morning if power to 179 Turbot Street is cut.	Correspondence	Flood Officer 3
	2:10 AM	BCC rang enquiring about a release strategy. Advised one will be issued at about 3:00am. Talked about the activities of the last 24 hours.	Correspondence	Flood Officer 3
	3:10 AM	Engineer 3 rang NPD Operator and advised no changes to gate settings planned for the next hour or so.	Correspondence	Flood Officer 3
	3:30 AM	Seqwater Mt Crosby WTP Manager called enquiring about levels at Mt Crosby.	Correspondence	Flood Officer 3
	3:50 AM	Engineer 1 called BoM advising him that because inflows are not as much as earlier anticipated, the releases from Wivenhoe are less than previously suggested.	Correspondence	Flood Officer 3
	4:05 AM	OIC of Lowood Police rang enquiring about the Wivenhoe fuse plug. Flood Officer 9 advised that there is no danger of the fuse plug failing, and that current releases from Wivenhoe Dam are about 4,900 cumecs.	Correspondence	Flood Officer 3
	4:40 AM	Seqwater Mt Crosby WTP Manager rang to check that his emails with the Mt Crosby levels were being received. They are.	Correspondence	Flood Officer 3
	5:15 AM	Dam Operations Manager rang enquiring current storage levels and releases. Engineer 3 advised.	Correspondence	Flood Officer 3
	5:30 AM	Dam Operations Manager rang enquiring estimated time for closing North Pine Dam. Engineer 1 advised possible today, but it has not yet been decided. Also advised the inflows into North Pine Dam were equivalent to a 1:10,000 event.	Correspondence	Flood Officer 3
	5:30 AM	Engineer 3 called Wivenhoe Dam for the current level. Dropped 2 cm in 30 minutes.	Correspondence	Flood Officer 3
	5:50 AM	Engineer 2 called BoM advising him that we have significantly scaled back releases from Wivenhoe Dam, and will probably continue to scale back more. Agreed that Savages Crossing has peaked.	Correspondence	Flood Officer 3
	6:00 AM	SDWD Model Updated - SDWD-201101120600withnorain.xls	Model Run	Flood Officer 9
	6:00 AM	North Pine Dam rang enquiring about closing down. Engineer 4 advised that we have not yet decided.	Correspondence	Flood Officer 3
	6:10 AM	Dam Operations Manager rang and suggested that the fish recovery may be a fairly big job. Engineer 4 suggested that our staff can check this morning and then decide.	Correspondence	Flood Officer 3
	6:15 AM	BCC rang enquiring the level of the pump station at Mt Crosby. Engineer 4 said we can't help, but that he should contact the treatment plant Manager.	Correspondence	Flood Officer 3
	6:30 AM	Engineer 4 rang Dam Operator 7 (Wivenhoe Dam) advising that a directive will soon follow to lower gates to 5m.	Correspondence	Flood Officer 3
	6:35 AM	DERM Hydrographer rang. Engineer 4 discussed current strategy.	Correspondence	Flood Officer 3
	7:00 AM	Liaised with Bureau regarding expected peak in lower Brisbane.	Correspondence	Flood Officer 9
	7:50 AM	SunWater called to confirm that 179 Turbot St had power.	Correspondence	Flood Officer 9

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	8:20 AM	Dam Operations Manager rang enquiring current storage levels and releases. Engineer 4 advised.	Correspondence	Flood Officer 2
	9:20 AM	North Pine Dam Operator rang wanting to speak to Engineer 4.	Correspondence	Flood Officer 2
	9:50 AM	Lowood Police rang enquiring current storage releases from Wivenhoe Dam. Engineer 4 advised.	Correspondence	Flood Officer 2
	10:20 AM	Dam Operator 2 (Somerset Dam) called querying whether FOC have received fax and email regarding storage level. He was checking the walls before and will be at his desk for the next 30 minutes. Dam Operator 13 is there with him.	Correspondence	Flood Officer 2
	10:50 PM	Seqwater rang wanting to thank Flood Officer 1 for his and John's heroic effort in clearing Seqwater basement.	Correspondence	Flood Officer 2
	11:20 AM	Flood Officer 7 called to inform that he and Senior Hydrographer (Seqwater) are not able to access Enviromon. He asked if Engineer 2 can check the system.	Correspondence	Flood Officer 2
	11:50 AM	Seqwater CEO called to ask that all communications be forwarded to him.	Correspondence	Flood Officer 9
	12:20 PM	Flood Officer 1 called Dam Operator 10 (Wivenhoe Dam) to advise that Seqwater comms are to be switched off due to flooding of the Margaret Street offices. Please send all future hourly bulletins to the FOC via fax, or alternatively, phone or TPG link.	Correspondence	Flood Officer 1
	12:25 PM	Flood Officer 1 called North Pine Dam advising that Seqwater comms are to be switched off due to flooding of the Margaret Street offices. Please send all future hourly bulletins to the FOC via fax, or alternatively, phone or TPG link.	Correspondence	Flood Officer 1
	12:32 PM	Leslie Harrison Dam Operator called Engineer 4. Due to the failure of Seqwater comms, he was seeking direction on how to submit a final report on operations at approx. 1600 today. Engineer 4 said to phone in to the FOC.	Correspondence	Flood Officer 1
	12:55 PM	BoM visited FOC to liaise with the Duty Engineers.	Correspondence	Flood Officer 1
	1:10 PM	Principal Dams and Weirs Planning called to request electronic copy of Wiv - Som Flood Ops manual to be forwarded to him.	Correspondence	Flood Officer 1
	1:15 PM	Dam Operator 10 (Wivenhoe Dam) called to report lake level: 74.79mAHD @13:00hrs. Note: Reading taken in surging water. Wivenhoe fax appears to have failed.	Correspondence	Flood Officer 1
	2:05 PM	North Pine Dam Operator called to inform that North Pine level was 39.74mAHD and based on this level he is recommending at least one gate closure.	Correspondence	Flood Officer 1
	2:10 PM	Dam Operator 9 phoned from Wivenhoe Dam. The SES (and irrigators) at Fernvale have concerns that a flood peak might be coming down the Lockyer within the next couple of hours. Engineer 1 assured Dam Operator 9 that the flood heights have reduced by up to 3 metres and any increase would be less than 1 metre.	Correspondence	Flood Officer 1
	2:25 PM	Dam Operator 10 (Wivenhoe Dam) called to report lake level: 74.81mAHD @14:00hrs. Note: Reading taken in surging water. Wivenhoe fax confirmed as failed.	Correspondence	Flood Officer 1

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	2:30 PM	North Pine Dam Operator called to advise that the automatic height gauge is drifting further from the manual gauge board readings. He will continue to provide both versions at hourly intervals but will rely on the manual gauge readings for gate operations.	Correspondence	Flood Officer 1
	3:05 PM	Dam Operator 7 (Wivenhoe Dam) called to report lake level of 74.81mAHD @ 15:00hrs.	Correspondence	Flood Officer 1
	3:30 PM	BoM called Engineer 2 to discuss re-appraisal of the expected flood peak in Brisbane. Peak now may be 5.2 metres early on Thursday 13/12/011.	Correspondence	Flood Officer 1
	4:00 PM	SDWD Model Updated - SDWD-201101121600.xls	Model Run	Flood Officer 9
	4:00 PM	Dam Operator 7 (Wivenhoe Dam) called to report lake level of 74.80mAHD @16:00hrs.	Correspondence	Flood Officer 1
	4:00 PM	North Pine Dam Operator called to report that Sideling Creek Dam is spilling at 20.560mAHD. Spillway level is 20.37mAHD.	Correspondence	Flood Officer 1
	4:20 PM	BCC called FOC and had phone conference with Duty Engineers. He was seeking update for briefing with Lord Mayor.	Correspondence	Flood Officer 1
	4:52 PM	DERM called FOC and left message for Engineer 2. They (DERM) will be gauging at Jindalee all night to catch the peak. Senior Hydrographer (Seqwater) has been contacted and will be joining the crew.	Correspondence	Flood Officer 1
	5:00 PM	Dam Operator 7 (Wivenhoe Dam) called to report lake level of 74.82mAHD @17:00hrs.	Correspondence	Flood Officer 1
	6:00 PM	Dam Operator 7 (Wivenhoe Dam) called to report lake level of 74.80mAHD @18:00hrs.	Correspondence	Flood Officer 1
	7:00 PM	Dam Operator 7 (Wivenhoe Dam) called to report lake level of 74.82 @19:00hrs.	Correspondence	Flood Officer 7
	7:45 PM	Engineer 1 & Engineer 3 advised BoM that FOC will be sending updated projected releases from Wivenhoe Dam. This has been prepared with the aim of limiting flows at Moggill to 3,500 cumecs.	Correspondence	Flood Officer 7
	8:00 PM	Engineer 1 & Engineer 3 advised BCC Flood Information Centre that FOC will be sending updated projected releases from Wivenhoe Dam. This has been prepared with the aim of limiting flows at Moggill to 3,500 cumecs.	Correspondence	Flood Officer 7
	8:55 PM	Dam Operator 7 (Wivenhoe Dam) called to report lake level 74.82mAHD @ 21:00hrs. They will now report levels every 2 hours.	Correspondence	Engineer 1
	9:15 PM	Dam Operator 7 (Wivenhoe Dam) called to inform that Energex restored power at Wivenhoe Dam at 21:15 hours.	Correspondence	Flood Officer 7
	9:50 PM	Mt Crosby WTP Manager provided an update on Kholo & Mt Crosby: Kholo 19:15hrs 20.0m Mt Crosby 21:00 23.5m He asked for a situation update. Engineer 1 shared Wivenhoe Dam's release strategy.	Correspondence	Flood Officer 7
	10:00 PM	Dam Operator 7 (Wivenhoe Dam) called to report lake level 74.81mAHD @22:00hrs. Will now report levels every 2 hours.	Correspondence	Flood Officer 7

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
Thursday 13 January 2011	12:00 AM	Dam Operator 7 (Wivenhoe Dam) called to report lake level 74.79mAHD @ 00:00.	Correspondence	Flood Officer 7
	1:00 AM	BCC called FOC to enquire if Wivenhoe Dam has been compromised. Engineer 3 assured him that that is not the case.	Correspondence	Flood Officer 7
	1:05 AM	Engineer 1 called BoM hotline number to check communications.	Correspondence	Flood Officer 7
	1:10 AM	BCC called the FOC regarding a viral text rumour that Wivenhoe Dam has failed. Engineer 3 assured him that that is not true and will speak with Dam Operations Manager about this matter.	Correspondence	Flood Officer 7
	1:20 AM	Queensland Police called to inform of rumours that Wivenhoe Dam has been compromised.	Correspondence	Flood Officer 7
	1:25 AM	Engineer 3 called Dam Operator 7 (Wivenhoe Dam) to confirm Wivenhoe Dam has not been compromised.	Correspondence	Flood Officer 7
	1:30 AM	Engineer 3 called Dam Operations Manager advising him about the rumours that Wivenhoe Dam has been compromised. Engineer 3 will send him the BCC contact details.	Correspondence	Flood Officer 7
	2:00 AM	Dam Operator 7 (Wivenhoe Dam) called to report level 74.765mAHD @ 2:00hrs.	Correspondence	Flood Officer 7
	4:00 AM	Dam Operator 7 (Wivenhoe Dam) called to report lake level 74.74mAHD @4:00hrs. Will now report levels every 2 hours.	Correspondence	Flood Officer 7
	6:00 AM	Dam Operator 7 (Wivenhoe Dam) called to report lake level 74.71mAHD @6:00hrs. Will now report levels every 2 hours.	Correspondence	Flood Officer 7
	6:43 AM	BoM called to inform that BoM has lost their telephone system. He provided 2 contact numbers: 1580. Thornton St 4.45m. Telemeter 4.20m	Correspondence	Flood Officer 7
	7:30 AM	Dam Operator 2 has been advising Kilcoy Police of the FOC strategy for lower Somerset during the next 24 hours of opening sluice later today	Correspondence	Engineer 1
	7:50 AM	BOM called to ask heights 3,500m ³ s would be at Savages and Mt Crosby. Engineer 2 advised 34.5m AHD and 16.5m AHD respectively.	Correspondence	Engineer 2
	8:05 AM	MBRC wanted to know when NPD gates will be closed. Advised to be closed by 0500 Friday	Correspondence	Engineer 2
	8:15 AM	Somerset directive #9 issued	Correspondence	Flood Officer 9
	9:00 AM	Dam Operations Manager wants to know when gates setting are changed on Wivenhoe and Somerset. Advised that NPD will be closed at 05 Friday.	Correspondence	Engineer 1
	9:00 AM	Dam Operator 2 advised of projected level for Somerset, 103.5 by 2000 Thursday and 102.8 early Friday morning. Will open another sluice this afternoon.	Correspondence	Engineer 2
10:10 AM	Dam Operations Manager called to inform that power and IT services have been restored at Seqwater.	Correspondence	Flood Officer 9	
10:30 AM	Dam Operations Manager called to request if he could be notified of any changes to releases from Wivenhoe	Correspondence	Flood Officer 9	

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	11:00 AM	SDWD Model Updated - SDWD-201101131100.xls	Model Run	Flood Officer 9
	1:00 PM	SRC rang to enquire about Kilcoy Creek and Mary Smokes Bridge. Duty Engineers advised that it may be out of water tonight, certainly by tomorrow morning.	Correspondence	Flood Officer 9
	1:15 PM	Dam Operations Manager called to advise that Police had called to ask when Kilcoy would be accessible. Engineer 4 advised Dam Operations Manager that it would be by 6am tomorrow morning (14/1).	Correspondence	Flood Officer 9
	1:40 PM	Mt Crosby WTP Manager called for update on Mt Crosby. Engineer 2 informed him that level would be maintained at 17.5 metres for next 7 days.	Correspondence	Flood Officer 9
	2:15 PM	Phone call from MBRC. Advice as follows: * damage to Gympie Rd abutments * No evacuations * No suburban flooding * Not aware of any over floor flooding. Pine Shire had 0.75m freeboard.	Correspondence	Flood Officer 9
	2:30 PM	Wivenhoe directive #36 issued • Open Gate 1 from 3.5 metres to 4.0 metres at 1500. • Open Gate 5 from 3.5 metres to 4.0 metres at 1600. • Open Gate 1 from 4.0 metres to 4.5 metres at 1700. • Open Gate 5 from 4.0 metres to 4.5 metres at 1800.	Correspondence	Flood Officer 9
	3:50 PM	NPD Operator called to confirm if FOC received Dam Observation report for North Pine Dam. Approx 6 of 40 uplift pressure gauges has abnormal readings.	Correspondence	Flood Officer 9
	4:45 PM	MBRC was advised that NPD gates will be closed at 0500 Friday	Correspondence	Engineer 2
	7:37 PM	SunWater called to confirm building services were working and all in order.	Correspondence	Flood Officer 4
	7:51 PM	Engineer 1 called North Pine Dam Operator to discuss the current drainage strategy to close all gates by 5am tomorrow. Water level in North Pine Dam will be frequently monitored against the predictive model results, and gate opening will be adjusted accordingly if required.	Correspondence	Flood Officer 4
	8:30 PM	Engineer 1 called Dam Operator 4 to advise of directive #11.	Correspondence	Flood Officer 4
	8:41 PM	Engineer 1 called Dam Operations Manager to advise of current release rates from Wivenhoe, Somerset and North Pine Dams.	Correspondence	Flood Officer 4
Friday 14 January 2011	12:46 AM	Ipswich District (Fernvale) Police rang to enquire into the integrity of Somerset Dam, based on information received by the Police. Engineer 1 indicated that surveillance procedures are in place to monitor the integrity of the Dam, and that Engineer 1 will confirm with the operators.	Correspondence	Flood Officer 4
	12:47 AM	Engineer 1 called Dam Operator 1 at Somerset to enquire to the integrity of Somerset Dam. Operator indicated all was good and no anomalies have been detected.	Correspondence	Flood Officer 4

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	12:49 AM	Engineer 1 called Ipswich District Police back on [REDACTED] to confirm that Somerset was recently inspected and all was ok.	Correspondence	Flood Officer 4
	5:13 AM	Fax received from North Pine Dam confirming closure of all gates.	Correspondence	Flood Officer 4
	5:15 AM	Engineer 1 called MBRC to advise that North Pine Dam has closed the final gate at 5am.	Correspondence	Flood Officer 4
	5:16 AM	North Pine Dam Operator called to confirm that all gates are closed, and Young's Crossing should be passable within 2 hours. Lake Kurwongbah level is 20.43 m.	Correspondence	Flood Officer 4
	5:28 AM	Dam Operations Manager called to obtain a situation report. Engineer 1 provided the key information.	Correspondence	Flood Officer 4
	5:37 AM	BCC called requesting information for Wivenhoe Dam and checking sit-rep data. Enquired about flows throughout the event, Engineer 2 advised that not currently in a position to discuss these.	Correspondence	Flood Officer 4
	7:40 AM	Dam Operations Manager rang FOC to enquire about river levels at Lowood. Pumps required to be installed to supply Lowood WTP. Engineer 2 advised RD that no significant rises were expected in the Brisbane River levels in the foreseeable future.	Correspondence	Flood Officer 1
	7:45 AM	ICC phoned the FOC. Enquiring about renewed rises in the Brisbane / Bremer River systems. He cannot contact BOM for an update. Engineer 2 advised that no significant rises were expected at Moggill. A constant flow in the river was the plan as a consequence of Wivenhoe releases.	Correspondence	Flood Officer 1
	8:20 AM	Principal Dams and Weirs Planning phoned Engineer 2. Enquiry regarding the Wivenhoe Dam fuse plugs (design calcs/parameters).	Correspondence	Flood Officer 1
	8:21 AM	Seqwater CEO phoned the FOC. Engineer 2 discussed with CEO the release strategy from Wivenhoe Dam with a view to opening the Fernvale Bridge and Mt Crosby Bridge at the earliest possible time. Engineer 2 also updated CEO on the projected City Gauge height over the next few days. This being ~2.5 metres due to continuous releases from Wivenhoe Dam.	Correspondence	Flood Officer 1
	8:30 AM	Engineer 2 returned call back to Principal Dams and Weirs Planning. Engineer 2 extended an invitation to him and others to pay a visit to the FOC to inspect operations.	Correspondence	Flood Officer 1
	10:10 AM	Dam Operator 2 rang from Somerset Dam. Checking that all comms avenues (faxes & e-mails) are functioning. All good.	Correspondence	Flood Officer 1
	10:25 AM	BCC rang TM. Enquiring if any chance of cutting back Wivenhoe releases to lower flows than the current figure of 3,500 cumecs. Engineer 2 response was NO!	Correspondence	Flood Officer 1
	10:40 AM	SunWater transmitted a message to Principal Dams and Weirs Planning that the right bank abutment to Mt Crosby Bridge has suffered some erosion due to the flooding and there are concerns that the abutment may be further affected by piping once the water level falls.	Correspondence	Flood Officer 1

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	10:50 AM	Operations Coordinator North rang from North Pine. The dam ceased flood operations at 5:00am this morning and fish recovery and clean-up has been completed. Approx. 31 lung fish were rescued. Quite a number of dead lung fish and other species. Erosion damage downstream of the dam is severe with loss of vegetation, stripped and fallen trees, bank erosion, and many dead fish caught within the root ball of fallen trees. He is organising back hoes and front end loader machinery to clear the debris between the NP dam wall and Grant Street.	Correspondence	Flood Officer 1
	12:33 PM	Flood Officer 7 phoned Engineer 2. Request from Seqwater Corp Comms about hourly updates. Particular concern about NPD which ceased flood operations at 5:00am this morning!! Engineer 2 advised that updates from the dams would continue to be channeled solely through the FOC.	Correspondence	Flood Officer 1
	12:35 PM	DERM phoned Engineer 2. Re: Gauging exercise at Jindalee:- Soundtek M9 from boat (6 passes) Jindalee gauging result:- 4,300m ³ /sec at 6:45 metres AHD at 12:00 hrs	Correspondence	Flood Officer 1
	12:37 PM	Seqwater CEP rang Engineer 2. Discussion about mis-informed reporting.	Correspondence	Flood Officer 1
	1:45 PM	Engineer 2 rang BCC seeking clarification on BCC's flood mapping. BCC advised that at 3,500 cumecs, BCC records indicate that 220 properties will have water on the property. Engineer 2 confirmed that 'water on the property' did not mean water above floor level i.e. Likely to be land inundation only.	Correspondence	Flood Officer 1
	1:53 PM	Dam Operations Manager rang Engineer 2. Routine call. Update on current status.	Correspondence	Flood Officer 1
	2:45 PM	Dam Operations Manager rang Engineer 2. Routine call. Update on current status.	Correspondence	Flood Officer 1
	3:30 PM	Dam Operator 10 rang from Wivenhoe Dam with concerns about some 'swirling' apparent in the downstream tailwater opposite 'The Common'. Dam Operator 10 thought there could be some erosion occurring under the flow. Matthew forwarded a marked photo of the phenomenon to Engineer 2. The consensus reached was that the phenomenon was the result of a 'hydraulic jump'. The matter would be referred to Engineer 4 for further investigation.	Correspondence	Flood Officer 1
	3:55 PM	Engineer 2 rang Engineer 4 to discuss the 'swirling' phenomenon identified by Dam Operator 10. Effect is at D/S end of plunge pool and is almost certainly a 'hydraulic jump'. Engineer 4 advised the issue was not of concern unless the phenomenon moves toward the flip bucket.	Correspondence	Flood Officer 1
	4:05 PM	Engineer 4 phoned Dam Operator 10 at Wivenhoe Dam to pass on advice that Engineer 4 had no concerns about the 'hydraulic jump' phenomenon identified by him earlier today.	Correspondence	Flood Officer 1
	4:50 PM	Mt Crosby WTP Manager phoned the FOC. Engineer 2 advised him that the current release strategy from Wivenhoe Dam (and therefore flows past the Mount Crosby WTPs) would be maintained until at least Monday (17/1).	Correspondence	Flood Officer 1
	5:50 PM	Dam Operations Manager rang Engineer 4 enquiring when the bridges to the east of Lake Wivenhoe would be clear of floodwater. Engineer 4 advised all but the Sandy Ck - A&PM Conroy Bridge on the Wivenhoe Somerset Rd would be clear by tomorrow (Sat) morning.	Correspondence	Flood Officer 1
	7:00 PM	FOC change over.	Other	Flood Officer 2

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
Saturday 15 January 2011	8:40 AM	Dam Operations Manager rang. Engineer 2 advised strategy to possibly go below FSL at Wivenhoe by Thursday.	Correspondence	Flood Officer 3
	8:42 AM	Seqwater CEO rang to advise that the media come into the FOC today to take photos.	Correspondence	Flood Officer 3
	11:30 AM	Dam Operations Manager rang to request a summary of the Operations Manual for Wivenhoe. Engineer 2 to provide after checking with all duty engineers.	Correspondence	Flood Officer 3
	12:12 PM	Dam Operations Manager rang to advise of a phone hook-up with the Minister and Seqwater CEO at 2:00pm, and requested that Engineer 1 be in at the FCO at that time.	Correspondence	Flood Officer 3
	12:20 PM	Seqwater CEO rang to confirm a phone hook-up with the Minister and CEO at 2:00pm.	Correspondence	Flood Officer 3
	12:55 PM	Engineer 2 advised Engineer 1 to come into the FOC for the phone hook-up at 2:00pm.	Correspondence	Flood Officer 3
	1:10 PM	Director Dam Safety phoned about the Wivenhoe Flood manual summary. Engineer 2 told Director Dam Safety that the summary is with the other duty engineers for checking before issuing.	Correspondence	Flood Officer 3
	1:15 PM	Dam Operations Manager rang with some questions on the Wivenhoe Flood manual summary.	Correspondence	Flood Officer 3
	1:45 PM	Engineer 1 and Engineer 4 arrived at the FOC for the 2:00pm phone hook-up.	Correspondence	Flood Officer 3
	2:00 PM	Phone hook-up with Engineer 2, Engineer 1, Engineer 4 with Dam Operations Manager, Director Dam Safety, Seqwater CEO, Joh Bradley and Bob Reilly to discuss a report for the minister by COB Sunday.	Correspondence	Flood Officer 3
	5:00 PM	Dam Operations Manager arrived to help write report for minister briefing.	Correspondence	Flood Officer 3
	7:30 PM	Dam Operator 7 from Wivenhoe called to discuss strategy for the next 12 hours.	Correspondence	Flood Officer 4
Sunday 15 January 2011	4:12 AM	Called Dam Operator 7 at Wivenhoe to confirm directive received via email. Directive being actioned ASAP.	Correspondence	Flood Officer 4
	7:10 AM	Dam Operator 2 (Somerset Dam) emailed flood centre indicating he believed flood centre phones were out. Tried to contact Dam Operator 2 by office and mobile phones with no success (Telstra message bank on office phone and Dam Operator 2's message on mobile). Flood centre phones were checked - working OK. Problem is with Somerset phones. Believe fax also not receiving. Dam Operator 2 emailed to confirm they have local calls but no STD. Continued checking mobile - no response.	Correspondence	Flood Officer 6
	8:20 AM	Called Dam Operator 10 at Wivenhoe to confirm directive 45 received. Confirmed not received - busy status on fax confirmation. Confirmed directive received via email.	Correspondence	Flood Officer 6
	9:40 AM	Retried all phones at Somerset - no response. Dam Operator 2 emailed to confirm that all phones are down at Wivenhoe. Email is still working and he will be checking emails every hour on the hour.	Correspondence	Flood Officer 6
	10:20 AM	Email confirmation received that Somerset Directive #12 implementation has been completed.	Correspondence	Flood Officer 6

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	11:30 AM	FOC contacted by Ipswich/Somerset District Disaster Coordinator notifying that the Wivenhoe viewing area has been damaged. Engineer 1 unable to contact Wivenhoe staff (Dam Operator 10) - message left. Then contacted Dam Operator 7, who confirmed that the area is damaged and has been locked off and 2 security guards are on site. It won't be opened until the water level falls and a full inspection of the structure has been completed. Engineer 1 confirmed this with Police, who reported that there was damage to safety rails and water supply to toilets. Dam Operator 10 also responded to Engineer 1's call and confirmed the details.	Correspondence	Flood Officer 6
	12:30 PM	Phone call from Dam Operator 10 (Wivenhoe) - neither fax nor email received. Verbal instruction given to implement gate operation as per Directive #46 and email resent.	Correspondence	Flood Officer 6
	12:40 PM	Contract programmer called to advise that the back-up Linux box "Namah" at Mineral House is showing file system corruption errors, so the FCC is effectively without backup. The hydraulic model in the RTFN is missing because two Fortran programs "Modcom 2" and "Modf" have not been ported to the Linux box.	Correspondence	Flood Officer 6
	12:55 PM	Engineer 1 advised SunWater Officer about the situation at Mineral House, and they will visit the backup operations centre ASAP.	Correspondence	Flood Officer 6
	1:10 PM	Dam Operator 2 (Somerset) called to report that the phones are now working.	Correspondence	Flood Officer 6
	2:40 PM	Engineer 2 spoke to Engineer 1. Grid manager wants a summary of flood volumes and peak discharges.	Correspondence	Flood Officer 6
	3:00 PM	SunWater Officer called - confirmed with Engineer 1 that the computer system at Mineral House has been rebooted and is functional.	Correspondence	Flood Officer 6
	3:10 PM	Dam Operations Manager rang to confirm current discharges. Confirmed 600 cumecs for Somerset and 3500 cumecs for Wivenhoe (approx).	Correspondence	Flood Officer 6
	4:00 PM	Directive #47 implemented - Gate 2 opened to 7.0 m.	Correspondence	Flood Officer 6
	6:52 PM	Engineer 1 spoke with Dam Operator 7 (Wivenhoe Dam) about Directive #48 Wivenhoe strategy. Dam Operator 7 confirmed receipt of Directive.	Correspondence	Flood Officer 7
	7:00 PM	FOC change over.	Other	Flood Officer 7
	10:00 PM	Dam Operator 7 (Wivenhoe Dam) called to inform 3 floor panels missing from bulks.	Correspondence	Flood Officer 7
Monday 17 January 2011	7:15 AM	Dam Operations Manager called to get Sit Rep. Advised that Somerset should remain mobilised until further notice	Correspondence	Flood Officer 8
	7:35 AM	Dam Operator 2 called - discussed strategy i.e. operate cone valves only from now on	Correspondence	Flood Officer 8
	9:15 AM	Mt Crosby WTP Manager called to find out about strategy for Wivenhoe shut down. Informed him that we will start closing down mid afternoon and aiming to have it closed by Wednesday	Correspondence	Flood Officer 8
	9:35 AM	Dam Operations Manager called to enquire when closing down will start and reminded us to inform Councils	Correspondence	Flood Officer 8
	10:00 AM	Advise Director Dam Safety about inconsistency between readings form BoM and actual HW gauges	Correspondence	Flood Officer 8

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	10:15 AM	SRC was contacted and advised gate close will commence this afternoon and Fernvale Bridge will be out of the water sometime Tuesday morning	Correspondence	Flood Officer 8
	10:20 PM	BCC was contacted (left message) advising gate close will commence this afternoon.	Correspondence	Flood Officer 8
	10:20 PM	ICC was contacted (left message) advising gate close will commence this afternoon.	Correspondence	Flood Officer 8
	11:15 PM	Called Mt Crosby WTP Manager to inform him that flow in Lockyer is 75m ³ /s and falling.	Correspondence	Flood Officer 8
	11:15 PM	Spoke to BCC. Advised him about gate closure. He mentioned that BCC will not provide any info on flood recurrence until they discussed with FOC.	Correspondence	Flood Officer 8
	11:20 AM	Dam Operations Manager called - Council wants to know draw down rates, so they can determine the effects on Coronation Dr. Engineer 3 informed Dam Operations Manager that BCC did not raise this when they spoke 10 mins before.	Correspondence	Flood Officer 8
	11:20 AM	Seqwater CEO called saying he will email a revised copy of response document	Correspondence	Flood Officer 8
	12:20 PM	Engineer 3 contacted BCC to get an update on Coronation Dr situation. Engineer 3 spoke to BCC. BCC advised he had spoken to BCC Geotec Officers and they had advised that @ this stage as Coronation Dr was back within the banks that they could not see an immediate problem. Some bank slumping have been identified further up the river. Council would like the recession of flow to be as flat as practicable but also that releases be as small as possible @ the Port Office gauge by the time of the high tide on Friday. This is consistent with our current strategy of closing releases by Wednesday 20 Jan 2010.	Correspondence	Flood Officer 8
	12:30 PM	Dam Operations Manager called, requesting an update on discussions with BCC. He requested that BCC confirm the discussion of 12:20 in writing.	Correspondence	Flood Officer 8
	1:01 PM	Dam Operations Manager called, saying MBRC wanted to know if there will be any more releases from NPD. Engineer 3 said nil planned unless we get more rain.	Correspondence	Flood Officer 8
	2:15 PM	Dam Operations Manager called, asking for dates and times for Wivenhoe operations at the peak of the flood.	Correspondence	Flood Officer 8
	3:15 PM	BoM called to confirm that he received the info on the discrepancy in the auto level recorder	Correspondence	Flood Officer 8
	4:15 PM	BoM - they have not received manual observations for days	Correspondence	Flood Officer 8
Tuesday 18 January 2011	12:30 AM	Seqwater CEO called to inform that rapidly dropping water level at Lowood was causing issues with pumping for WTP. Asked if FOC could call Esk WTP Team Leader and then notify him via txt of the outcome.	Correspondence	Flood Officer 9
	12:35 AM	FOC contacted Esk WTP Team Leader in regards to pumping issues at Lowood. Engineer 3 decided to halt all gate operations until further notice in order to ensure security of water supply to Lowood.	Correspondence	Flood Officer 9
	1:00 AM	Text message sent to Seqwater CEO to advise of cessation of Wivenhoe gate operations until further notice.	Correspondence	Flood Officer 9
	2:00 AM	BCC advise that the recession at Coronation Drive is not an issue with regards to bank stability	Correspondence	Flood Officer 9
	5:00 AM	Dam Operator 7 called to advise that Fernvale Bridge was emerging from river. Current release 2054 cumecs.	Correspondence	Flood Officer 9

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	5:40 AM	Dam Operator 7 called to advise that the approach to the Fernvale Bridge from the Fernvale side was still underwater due to water backed up in the quarry.	Correspondence	Flood Officer 9
	5:45 AM	Called Esk WTP Team Leader to advise that Wivenhoe gate operations would recommence close down sequence from 9am as per original strategy. He to advise FOC if pumping operation at Lowood would benefit from additional 3 - 6 hours delay in gate operations.	Correspondence	Flood Officer 9
	7:25 AM	Dam Operator 7 (Wivenhoe) called to advise that a Surveyor is taking a routine deformation survey	Correspondence	Flood Officer 5
	7:35 AM	BCC enquired about preliminary assessment of magnitude of flood. BCC suggested that Seqwater, BOM and BCC should arrive at a consensus regarding any assessment on the magnitude of the event. Engineer 1 agreed. BCC also enquired if we had done an assessment of the effects of the dam on peak flow. Engineer 1 indicated that our prelim figure was a 13000 cumec peak at City Gauge without the Dams.	Correspondence	Flood Officer 5
	8:25 AM	Dam Operator 10 (Wivenhoe) called to acknowledge Directive 55	Correspondence	Flood Officer 5
	10:10 AM	Seqwater at Mt Crosby has requested some forward projections for flows at Mt Crosby Weir for the next 48 hours. They are looking at sludge dilution.	Correspondence	Flood Officer 5
	10:15 AM	Engineer 1 called West Bank WTP back to provide the following info re projected flows at Mt Crosby Weir: 18/1/2011 10:00 - 2300 cumecs 19/1/2011 10:00 - 1130 cumecs 20/1/2011 10:00 - 360 cumecs	Correspondence	Flood Officer 5
	10:19 AM	BCC Flood Information Centre called to advise that Campbell Newman wants an indication of what the flood would have been without dams and asked if the figure of 13000 cumecs provided to BCC earlier could be released to the public.	Correspondence	Flood Officer 5
	10:24 AM	Engineer 1 spoke to Dam Operations Manager to ask Seqwater's policy re release of information above. Dam Operations Manager to confirm with his comms people.	Correspondence	Flood Officer 5
	10:30 AM	Seqwater comms officer called to advise that the minister's office has recommended that no info regarding releases from WD be released to anybody. He will now communicate this response to the BCC Flood Info Centre.	Correspondence	Flood Officer 5
	10:38 AM	SRC requested info re when Burtons Bridge is expected to be free from inundation. Under our current shutdown sequence, Engineer 1 advised that we expect Burtons to be free around midnight on Wed evening. SRC also advised that the bridge on New England Creek will become flood free at around the same time. SRC indicated that at 8am today the approaches to Fernvale were clear of water. However, power lines and silt need to be removed. He expects the bridge to be open this afternoon.	Correspondence	Flood Officer 5
	10:55 AM	Principal Dams and Weirs Planning (Seqwater) called to confirm that we received the hydraulic model from WRM. (affirmative)	Correspondence	Flood Officer 5
	12:05 PM	Seqwater CEO called to advise that he and DERM will come and visit the FOC at 2:30 this afternoon.	Correspondence	Flood Officer 5

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	12:26 PM	Dam Operations Manager called to confirm programmed final shutdown. Engineer 1 advised scheduled for 9am Thursday 20/1 2011. Dam Operations Manager to confirm fish recovery.	Correspondence	Flood Officer 5
	1:22 PM	Confirmed with Dam Operator 10 that gate closure sequence was in accordance with directive as email received from WD re 13:00 closure was incorrect.	Correspondence	Flood Officer 5
	2:00 PM	Engineer 4 called for an update of the closedown sequence	Correspondence	Flood Officer 5
	2:15 AM	Engineer 1 called WRM re hydraulic model of Brisbane River...login and password not working...help not available at present	Correspondence	Flood Officer 5
	2:30 PM	Seqwater CEO and DERM visited FOC to check current situation and to pass on thanks for job performed so far. Also requested that we hold further gate operations until problems at Lowood Pump Station are resolved.	Other	Flood Officer 5
	4:05 PM	Engineer 1 called NPD Operator to alert him to the possibility of operating North Pine Dam with incoming storms.	Correspondence	Flood Officer 5
	4:30 PM	Dam Operations Manager rang noting the current storms and requested that Engineer 1 call MBRC to advise of the possibility of operating North Pine Dam.	Correspondence	Flood Officer 5
	4:34 PM	Email from Seqwater CEO containing approval to vary the flood release regime to enable a constant flow for the Lowood WTP offtake.	Correspondence	Flood Officer 5
	4:45 PM	Engineer 1 rang MBRC to advise of the possibility of operating North Pine Dam in the next day or so if predicted falls of up to 50mm occurred.	Correspondence	Flood Officer 5
	6:25 PM	Dam Operations Manager called to discuss situation report for North Pine.	Correspondence	Flood Officer 5
	6:57 PM	Engineer 4 phoned MBRC. Message left regarding plans to open NPD gates this evening as the lake level is approaching trigger level with more rain / showers forecast.	Correspondence	Flood Officer 1
	7:02 PM	Engineer 4 phoned NPD Operator regarding mobilising for NPD gate opening this evening. Tentative plan is for commencement of gate opening at 20:30.	Correspondence	Flood Officer 1
	7:05 PM	Engineer 4 phoned the Duty Officer at MBRC regarding the planned imminent opening of the NPD gates. Target time is 20:30 if Council has the barriers in place closing Youngs Crossing Road and the dam is fully manned.	Correspondence	Flood Officer 1
	7:05 PM	Flood Officer 1 phoned Dam Operations Manager to provide an update on the NPD mobilisation and proposed gate openings.	Correspondence	Flood Officer 1
	7:07 PM	Engineer 4 phoned Operations Coordinator North to advise of planned gate opening of NPD this evening. Cessation of operations (i.e. gate closure) is expected to be arranged for tomorrow morning (19/1) in order for Youngs Crossing Road to be opened to peak hour traffic. Engineer 4 advised Operations Coordinator North to plan for an early morning fish recovery exercise at NPD.	Correspondence	Flood Officer 1
	7:10 PM	MBRC returned phone call to Engineer 4. Engineer 4 repeated information already conveyed to MBRC Duty Officer - regarding requirement for Youngs Crossing Road to be closed to traffic to allow NPD gates to be operated by 20:30 if possible.	Correspondence	Flood Officer 1

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	7:15 PM	Engineer 4 phoned Seqwater regarding Engineer 4 inability to access Citrix. Outage (?). Message left.	Correspondence	Flood Officer 1
	7:15 PM	Engineer 4 phoned Dam Operations Manager regarding Citrix comms outage. Message left requesting Dam Operations Manager to intervene to have the problem fixed.	Correspondence	Flood Officer 1
	7:20 PM	IT (Seqwater) rang and 'reset' Citrix for Engineer 4.	Correspondence	Flood Officer 1
	7:30 PM	Engineer 4 phoned NPD Operator to confirm gate opening arrangements for 20:30 if Youngs Crossing Road has been closed to traffic by Council at that time.	Correspondence	Flood Officer 1
	7:40 PM	Dam Operations Manager rang the FOC to enquire if the Citrix issue was sorted. Citrix connection now functioning. Engineer 4 expressed concern about the current release strategy for Wivenhoe Dam. If the current release rate is maintained (set to accommodate Lowood temporary raw water pumps), the model indicates that the lake level could fall well below FSL (~ EL 65.00??).	Correspondence	Flood Officer 1
	7:42 PM	Engineer 4 phoned Executive GM Water Delivery (Seqwater) to seek advice on who could supply the most up-to-date status report on the current situation at Lowood regarding river levels and pumping activities to supply the WTP. He suggested Water Treatment Team Leader (Seqwater).	Correspondence	Flood Officer 1
	7:45 PM	Engineer 4 phoned Principal Strategic Asset Maintenance Engineer (Seqwater) seeking info Re: Lowood. Maintenance Engineer referred Engineer 4 to Strategic Asset Maintenance Engineer (Civil).	Correspondence	Flood Officer 1
	7:50 PM	Engineer 4 phoned Maintenance Engineer (Civil). - Reportedly on site at Lowood PS. No answer. Message left.	Correspondence	Flood Officer 1
	7:52 PM	Engineer 4 phoned Lowood WTP Operator to enquire as to current status regarding temporary pumping arrangements of raw water from the Brisbane River.	Correspondence	Flood Officer 1
	7:55 PM	Dam Operator 2 (Somerset Dam operator) phoned the FOC from home seeking the Duty Engineer's intentions for operations at Somerset Dam overnight. Engineer 4 requested a Gauge Board reading of the lake level and advised that an operations strategy for Somerset Dam would be addressed within 30 minutes - following satisfactory mobilisation of NPD.	Correspondence	Flood Officer 1
	8:00 PM	Seqwater IT phoned Engineer 4 to check status of Citrix connection. Citrix connection is functioning.	Correspondence	Flood Officer 1
	8:05 PM	Dam Operator 2 phoned from Somerset Dam. Current lake level is EL 98.95 unchanged from lake level at 15:35 today.	Correspondence	Flood Officer 1
	8:05 PM	Engineer 4 phoned Dam Operator 9 at home. Engineer 4 requested Dam Operator 9 to visit Lowood pumping intake site and report on status as unable to contact Maintenance Engineer (Civil).	Correspondence	Flood Officer 1
	8:11 PM	Engineer 4 phoned Dam Operator 2 (Somerset). Dam Operator 2 to send fax in with lake level. Likely strategy will be to close off the regulator overnight and re-assess the situation in the morning.	Correspondence	Flood Officer 1

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	8:12 PM	Engineer 4 conversed with Manager Strategic Maintenance (Seqwater). He advised that arrangements are in hand to move the temporary pumps at the Brisbane River site at Lowood. The pumps are being re-located downhill to maintain extraction of raw water from the river to supply the Lowood WTP.	Correspondence	Flood Officer 1
	8:15 PM	Maintenance Engineer (Civil) contacted Engineer 4. The temporary raw water pumps at Lowood are being moved closer to the river - chasing the anticipated lower level in the river due to reduced releases from Wivenhoe.	Correspondence	Flood Officer 1
	8:18 PM	Dam Operations Manager rang the FOC to seek an update on operations at all 3 storages.	Correspondence	Flood Officer 1
	8:25 PM	Engineer 4 confirmed on-site manning arrangements at Lowood with Dam Operator 9.	Correspondence	Flood Officer 1
	8:30 PM	Somerset Dam Operator advised FOC by fax that Regulator #12 had been closed as per verbal advice from Engineer 4.	Information	Flood Officer 1
	8:35 PM	Engineer 4 contacted Dam Operator 7 at Wivenhoe. Gate closing directive pending.	Correspondence	Flood Officer 1
	8:55 PM	NPD Operator phoned the FOC. MBRC have only just closed off Youngs Crossing Road. By the time the siren is sounded, the gate openings in Directive 31 scheduled to commence at 20:30 will be delayed by 45 minutes.	Correspondence	Flood Officer 1
	9:00 PM	Duty Officer at MBRC rang Engineer 4 to advise that Youngs Crossing Road was now closed. Engineer 4 advised Duty Officer that it was intended to maintain releases from NPD through until 5:00am Wednesday 19/1. With this operating strategy, Young's Crossing Road should be able to be re-opened to traffic by 7:00am tomorrow.	Correspondence	Flood Officer 1
	9:05 PM	Note: Wivenhoe Dam fax machine is still inoperative	Correspondence	Flood Officer 1
	9:08 PM	Engineer 4 phoned Operations Coordinator North to advise of planned gate opening of NPD this evening.	Correspondence	Flood Officer 1
	9:15 PM	Dam Operations Manager phoned Engineer 4 to discuss the Wivenhoe release strategy and its potential to effect bank slumping at Coronation Drive. The changed situation at Lowood means that the reduction in Brisbane River levels will now be far more even. Dam Operations Manager advised that Coronation Drive is no longer a concern.	Correspondence	Flood Officer 1
	9:30 PM	Flood Officer 1 phoned BCC and made contact with BCC's Flood Operations (Disaster Management) Centre. Engineer 4 requested confirmation that Coronation Drive would not be adversely affected by way of bank slumping if releases from Wivenhoe were terminated on Wednesday afternoon. Engineer 4 requested BCC to investigate and call back the FOC.	Correspondence	Flood Officer 1
	9:38 PM	Flood Officer 1 contacted Dam Operator 7 at Wivenhoe Dam by 2-way radio to confirm his receipt of e-mail containing Directive #59. Dam Operator 7 also confirmed that the Wivenhoe fax machine is still inoperative. All written comms to be by e-mail.	Correspondence	Flood Officer 1
	9:50 PM	Engineer 4 phoned Dam Operations Manager. Wivenhoe release strategy discussed regarding Lowood WTP temporary offtake level, concerns about Coronation Drive bank slumping and lake level at cessation of releases if targeted for tomorrow afternoon.	Correspondence	Flood Officer 1

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	9:53 PM	BCC's Flood Operations (Disaster Management) Centre phoned Engineer 4. Wivenhoe release strategy and effect on Coronation Drive discussed. BCC have no concerns about imminent cessation of Wivenhoe releases. Engineer 4 explained that it was more likely that the tidal variation at Toowong would have a greater impact on the river banks than the Wivenhoe releases.	Correspondence	Flood Officer 1
	10:00 PM	Engineer 4 phoned NPD Operator to discuss release strategy i.e. planned gate openings to setting #2 followed by closure sequence to be completed by early tomorrow morning (19/1).	Correspondence	Flood Officer 1
	10:02 PM	Dam Operations Manager phoned Engineer 4. Release strategy and final lake level at gate closure at Wivenhoe discussed.	Correspondence	Flood Officer 1
	10:14 PM	Dam Operator 9 phoned Engineer 4. Situation at Lowood is under control. Engineer 4 advised Dam Operator 9 that the releases at Wivenhoe are planned to cease by early afternoon tomorrow (19/1).	Correspondence	Flood Officer 1
Wednesday 19 January 2011	3:30 AM	Engineer 4 phoned the Mount Crosby WTP to obtain an update on the status of the Mount Crosby Weir Bridge. It is currently clear of water and came out of inundation approx 14:00 yesterday (18/1). The bridge has reportedly suffered some damage. Details unknown.	Correspondence	Flood Officer 1
	4:38 AM	Engineer 4 advised Dam Operator 7 at Wivenhoe Dam that the strategy for further gate closures after 0500 was dependant on the outcome of a discussion with Seqwater CEO anticipated within the hour. Dam Operator 7 advised that the Fernvale Bridge was clear of floodwater but that it had power lines down on /around it.	Correspondence	Flood Officer 1
	5:05 AM	Dam Operator 7 from Wivenhoe Dam phoned the FOC to report that some erosion has occurred in the vicinity of the plunge pool downstream of the flip bucket. This has become evident now that the gate releases have been reduced. Some large boulders (~ 10t) are evident piled up against the bench D/S of the flip bucket. Engineer 4 will need to inspect the damage ASAP.	Correspondence	Flood Officer 1
	5:10 AM	Engineer 4 phoned Seqwater CEO to obtain a Govt. view on how long to maintain releases and to where the lake level should be held following closure of all gates. Timing of the gate closure might be dependant on the erosion issue.	Correspondence	Flood Officer 1
	5:15 AM	Engineer 4 phoned Engineer 2 to arrange for Engineer 2 to relieve Engineer 4 ASAP in the FOC as he is required to inspect the reported damage at Wivenhoe Dam.	Correspondence	Flood Officer 1
	5:20 AM	Engineer 4 phoned Principal Dams and Weirs Planning (Seqwater) to arrange a joint inspection of the erosion damage at Wivenhoe Dam as reported by Dam Operator 7.	Correspondence	Flood Officer 1
	5:25 AM	Dam Operations Manager phoned Engineer 4 to obtain an update. Engineer 4 advised Dam Operations Manager that damage has been reported to the area D/S of the flip bucket at Wivenhoe. An inspection ASAP is warranted.	Correspondence	Flood Officer 1
	5:30 AM	Engineer 4 phoned Director Dam Safety to advise that damage had been reported at Wivenhoe Dam by the operator. Initial information indicates that large boulders are piled up in the plunge pool D/S of the flip bucket. The source of these boulders is unknown as releases are still continuing from the gates. Engineer 4 has arranged to inspect the site with Principal Dams and Weirs Planning in a few hours and an invitation was extended to Director Dam Safety as an interested party to attend the inspection. Engineer 4 will provide updates as they come to hand.	Correspondence	Flood Officer 1

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	5:35 AM	Dam Operator 7 phoned Engineer 4 on his mobile phone with an update report.	Correspondence	Flood Officer 1
	8:08 AM	Engineer 4 phoned Engineer 2. Things seem to be O.K. but we will continue to close all gates by this afternoon.	Correspondence	Flood Officer 2
	8:20 AM	Engineer 2 phoned Flood Warning Centre advising that flood operation for current event will be shut down around lunch time.	Correspondence	Flood Officer 2
	9:23 AM	Engineer 4 phoned Engineer 2 asking whether we should run a regulator.	Correspondence	Flood Officer 2
	9:51 AM	Engineer 2 phoned Engineer 4 regarding modelling results.	Correspondence	Flood Officer 2
	10:00 AM	Engineer 2 phoned Engineer 4 regarding modelling results. Engineer 2 wants to advise Dam Operator 7 to stop at Gate 3 at 1 metre, but they agree to close as planned and maintain operational release instead of flood release.	Correspondence	Flood Officer 2
	10:15 AM	Engineer 4 has discussed the event closure with Director Dam Safety. It was agreed that the flood will be considered closed with the closure of the gates at 1200. At that time, control of the dam will revert to Seqwater. As the low flow channel to the regulator is blocked, the centre gate will be opened to 1 metre to manage on-going inflows with the aim of getting to 95% (EL 66.5).	Correspondence	Engineer 2
	10:43 AM	Received QPF - 15mm-25mm generally, heavier falls to about 50mm in Brisbane and North Pine catchments.	Other	Flood Officer 2
	11:14 AM	Engineer 3 phoned Engineer 2 - Still operational until tonight.	Correspondence	Flood Officer 2
	11:28 AM	Seqwater at Mt Crosby phoned FOC requesting for peak flow at Mt Crosby Weir during the latest event.	Correspondence	Flood Officer 2
	11:36 AM	Engineer 2 phoned Engineer 4 confirming that Engineer 3 and Flood Officer 8 will be on tonight.	Correspondence	Flood Officer 2
	11:45 AM	Engineer 2 phoned Mt Crosby advising that peak flow over Mt Crosby Weir was about 9150 cumecs.	Correspondence	Flood Officer 2
	11:51 AM	Engineer 2 phoned (left message with) MBRC regarding potential for closing operation tonight.	Correspondence	Flood Officer 2
	11:52 AM	Engineer 2 phoned (left message with) Operations Coordinator North to call him back.	Correspondence	Flood Officer 2
	11:59 AM	Engineer 4 phoned Engineer 2 stating that divers will investigate erosion d/s Wivenhoe Dam today.	Correspondence	Flood Officer 2
	1:25 PM	Mt Crosby phoned Engineer 2 discussing about the information which Engineer 2 sent.	Correspondence	Flood Officer 2
	1:39 PM	Dam Operator 10 phoned Engineer 2 advising Wivenhoe Dam EL is 66.89 m AHD.	Correspondence	Flood Officer 2
	3:21 PM	MBRC phoned wanting AJ Wyllie Bridge to be closed at 9:00 PM rather than 7:00 PM, and stating that she will update 24 hour call centre number. They will send email to confirm all this.	Correspondence	Flood Officer 2
	4:00 PM	Received QPF - 15mm-25mm generally, heavier falls to about 50mm in Brisbane and North Pine catchments.	Other	Flood Officer 2
	7:30 PM	MBRC called to say that the alternate route @ Petri is open (sooner than the 9 PM forecast)	Correspondence	Flood Officer 8
	9:10 PM	Called Operations Coordinator North to inform him that NPD will be mobilised.	Correspondence	Flood Officer 8
	9:10 PM	Called NPD Operator to mobilise. The WL is approaching trigger level for gate opening.	Correspondence	Flood Officer 8

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	9:20 PM	Called MBRC call centre to inform them that NPD will be operated. They called back and advised that they can close Young's crossing by 11 PM. They will confirm once road is closed.	Correspondence	Flood Officer 8
	9:38 PM	NPD Operator called to confirm they are ready The gauge reading was 39.54 @ 9:30PM	Correspondence	Flood Officer 8
	2:15 AM	MBRC called regarding release at NPD. He was advised that the gates will be open for a while yet	Correspondence	Flood Officer 8
	6:50 AM	MBRC called to find out when the gates on NPD will be shut. They were advised that the gates will only be closed in time for the afternoon peak.	Correspondence	Flood Officer 8
	7:20 AM	Engineer 1 called SRC to advise of flow in Lockyer Creek. SRC concerned about Burtons Bridge but Engineer 1 indicated that we will endeavour to keep flows below 400 m3/s.	Correspondence	Engineer 1
	7:25 AM	Engineer 1 called ICC and advised of renewed flows in Lockyer Creek and Middle Brisbane River.	Correspondence	Engineer 1
	7:40 AM	Engineer 1 called BCC and advised of increased flows in Lockyer Creek and Middle Brisbane. Advised that Savages Crossing and/will be Colleges Crossing are inundated. Estimated travel time 30 to 36 hours.	Correspondence	Engineer 1
	7:55 AM	Engineer 1 called NPD and spoke to Dam Operator 7. Discussed proposed strategy to drain until around 2:00 PM with current gate settings. Requested hourly readings so as to monitor model performance.	Correspondence	Engineer 1
	8:00 AM	NPD Operator called to discuss proposed operations. Engineer 1 indicated that we will continue as is until 10:00am QPF comes in and then decide from there as to strategy.	Correspondence	Engineer 1
	8:40 AM	Dam Operations Manager called enquiring about the timeliness of the notice we gave to MBRC. Engineer 1 advised him accordingly.	Correspondence	Flood Officer 2
	8:45 AM	Flood Officer 9 called (re Lowood pump station) enquiring the time to peak (height and discharge). FOC response was about 9 hours with height of about 3.7 m corresponding to 300 cumecs.	Correspondence	Flood Officer 2
	8:50 AM	Flood Officer 9 called (re Lowood pump station) enquiring current height and discharge. Together we estimated that it was about 150 cumecs (50 from Lockyer Creek and 100 from Wivenhoe Dam) corresponding to about 2.4m.	Correspondence	Flood Officer 2
	9:45 AM	Dam Operations Manager advised Wivenhoe will not be drained to 66.5 m AHD, but will be maintained at or just below FSL.	Correspondence	Flood Officer 2
	10:21 AM	Received QPF - 15mm-25mm generally, heavier falls to about 50mm in Brisbane and North Pine catchments.	Other	Flood Officer 2
	10:30 AM	Dam Operations Manager called enquiring whether closing all releases in Wivenhoe Dam will cause level to exceed gate trigger in the next three day. Engineer 1 advised that with rain on the ground he expects it not to, however forecast as per QPF is 15-25 mm, so we may need to review that decision tomorrow.	Correspondence	Flood Officer 2
	11:12 AM	MBRC called. Engineer 1 advised all gates will be closed at 2:00 PM.	Correspondence	Flood Officer 2
	11:14 AM	Engineer 1 phoned Operations Coordinator North. They decided to close NPD by 2pm to allow MBRC to open Young's Crossing for afternoon peak.	Correspondence	Flood Officer 2

APPENDIX M – FLOOD EVENT LOG (continued)

Date	Time	Action	Category	Title
	11:15 AM	Flood Officer 9 called enquiring peak height and discharge at Lowood with Wivenhoe Dam gates closed. We decided to just minus 100 cumecs from previous estimation. He also wants FOC to email him the Lowood rating curve.	Correspondence	Flood Officer 2
	11:33 AM	Engineer 1 called NPD Operator (re Directive 36)	Correspondence	Flood Officer 2
	11:36 AM	Engineer 1 called Engineer 2. Engineer 2 will monitor situation overnight and Engineer 1 will become Duty Engineer again tomorrow.	Correspondence	Flood Officer 2
	11:44 AM	Communications Advisor, Media and Ministerial (Seqwater) called to confirm whether we have closed all gates at Wivenhoe Dam. Flood Officer 2 said yes.	Correspondence	Flood Officer 2
	1:07 PM	Dam Operations Manager called confirming NPD closure.	Correspondence	Flood Officer 2
	1:35 PM	Communications Advisor, Media and Ministerial (Seqwater) called about Lowood pump motor sitting on the platform and wanting to know what flow will come down from Lockyer. Engineer 1 said about 300 cumecs.	Correspondence	Flood Officer 2
	1:37 PM	Engineer 2 called. Flood Officer 8 will be on tonight (Flood Officer 2 should ring him this afternoon). Mt Crosby Weir gauge is broken so Water Treatment boys will give manual readings via BoM website. City gauge is currently reading 0.3 m high.	Correspondence	Flood Officer 2
	2:10 PM	Engineer 1 advised MBRC that North Pine Dam gate operations had ceased at 14:00 and that Youngs Crossing should be clear of water within the next hour to an hour and half.	Correspondence	Engineer 1
	2:15 PM	Engineer 1 called NPD Operator and indicated that Engineer 2 will be on call tonight monitoring the situation. NPD Operator advised that the tree branch snagged on Gate C had swung around and was now resting on pier - therefore okay. However a 75mm branch was caught in the ropes of Gate B and may need to be removed before another operation. Operations Coordinator North has organised for the Rangers to examine tomorrow.	Correspondence	Engineer 1
	2:40 PM	Dam Operator 2 called from Somerset Dam and enquired as to proposed operational release strategy. Engineer 1 advised that no releases planned for now until Wivenhoe spillway issues are resolved.	Correspondence	Engineer 1
	3:20 PM	Engineer 1 called MBRC Call Centre to provide heads up on possible gate operations tonight. Indicated that with 25mm over catchment we will commence gate operations at 21:00.	Correspondence	Engineer 1

APPENDIX N – FLOOD OPERATIONS ENGINEERS RESUMES

Engineer 1

Engineer 1 has a Bachelor of Engineering (Civil) and a Post Grad Certificate in Hydrology. He has over 26 years experience in water engineering during which time he has gained expertise in hydrology and water resource studies. He is currently Manager of a major design group which provides civil design services for a range of water supply infrastructure projects including dams, weirs and fish transfer systems. The team's 20 professional and technical staff are responsible to Engineer 1 for service delivery to clients.

Engineer 1's main areas of expertise include design flood estimation and hydraulic modeling of flood plain flows and project management. He is proficient in the use of numerous hydrologic and hydraulic modeling packages and he is involved in leading a number of project teams. He has authored numerous technical reports and publications.

He has also served on technical panels within the water industry.

Engineer 2

Engineer 2 holds a Bachelor of Engineering and a Master of Engineering Science. He has held senior positions in well recognized major modeling groups. His core specialist skills are in hydrological modeling including real time forecasting and design flood hydrology. He is recognized in the area of flood forecasting and authored/co-authored many papers in the field.

His hydrological modeling skills have been developed through over 25 years experience in the water industry including the developing of major hydrological models and flood forecasting systems in Australia and overseas. He has delivered training programs to both national and international flood forecasting agencies and has authored numerous flood management reports.

Engineer 2 has provided advice and expertise in the field of flood forecasting to interstate and international agencies.

He has also served on technical panels within the water industry.

He is currently managing the development of a major flood forecasting package.

APPENDIX N – FLOOD OPERATIONS ENGINEERS RESUMES

(continued)

Engineer 3

Engineer 3 has a degree in engineering and a post graduate qualification in Engineering where his studies had a focus on hydrology. He is an experienced hydrologist with almost 30 years experience in the water industry. He has broad range of expertise in hydrology which includes such topics as catchment hydrology, erosion, flood hydrology, hydraulic modeling, water security, real time flood management and design flood hydrology. He has authored numerous technical reports and papers covering these topics.

He has been involved in a number of national projects which have developed some of the methodologies associated with design flood hydrology for dam design and floodplain management.

Engineer 3 is currently managing a large group of professionals working in the water industry.

He has also served on technical panels within the water industry.

Engineer 4

Engineer 4 has a degree in Civil Engineer with almost 30 years experience in the Queensland Water Industry. Engineer 4 has held roles in design, construction and operations working on major bulk water supply projects throughout Queensland. Engineer 4 is one of Australia's most experienced civil engineers in relation to the management of flood operations at gated dams, having at various times been responsible for managing operations and maintenance at eight major gated dams.

As well as being an experienced civil engineer, Engineer 4 holds complementary tertiary qualifications in environmental impact assessment, infrastructure management, operations management, electrical engineering and computing.

Engineer 4 is currently responsible for developing dam safety management programs.

APPENDIX R – RATINGS

Stream Height Station Ratings

Calibration of the runoff routing model is performed by comparing modelled flows with estimated recorded flows. In turn, these estimated recorded flows are derived from recorded height through the appropriate stream rating curve. Thus rating curves are critical to the modelling process and it is important that there is an appreciation of the reliability of the height to flow relationship at each site. One method of appreciating this reliability is by comparing the highest gauged (or measured) flow with the highest estimated recorded flow at each gauging station, sometimes termed the 'rating ratio'.

The rating reliability for the gauging stations is shown in the Table below:-

ALERT ID	Stream	Location	Rating Ratio (%)
6543	Cooyar Creek	Damsite	18
6718	Brisbane River	Linville	34
6521	Emu Creek	Boat Mountain	15
6515	Brisbane River	Gregors Creek	30
6554	Cressbrook Creek	Rosentretters	12
6527	Lockyer Creek	Helidon	23
6566	Tenthill Creek	Tenthill	21
6584	Laidley Creek	Showground Weir	21
6634	Lockyer Creek	Lyons Bridge	26
6631	Lockyer Creek	Rifle Range Road	40
6560	Brisbane River	Savages Crossing	60
6752	Brisbane River	Mt Crosby Weir	25
6581	Bremer River	Adams Bridge	45
6551	Bremer River	Walloon	?
6563	Warrill Creek	Kalbar	39
6652	Warrill Creek	Amberley	19

APPENDIX R – RATINGS (continued)

APPENDIX T – RAINFALL STATION TEMPORAL PATTERNS

Temporal patterns for selected stations in the table below are located in the sub-catchment of those shown in the map and are plotted below to demonstrate the difference between sub-catchment and station intensities and patterns.

ALERT ID	Station	Latitude	Longitude
6514	Gregors Creek-P	-26.9800	152.4040
6542	Cooyar Creek	-26.7417	152.1367
6556	Glenore Grove	-27.5242	152.4081
6598	Toowoomba	-27.5114	151.9536
6649	Lowood-P	-27.4900	152.5930
6680	Mt Glorious P	-27.3220	152.7470
6716	West Bellthorpe	-26.8230	152.6780

APPENDIX T – RAINFALL STATION TEMPORAL PATTERNS (continued)

APPENDIX T – RAINFALL STATION TEMPORAL PATTERNS (continued)

APPENDIX T – RAINFALL STATION TEMPORAL PATTERNS (continued)

APPENDIX U – WIVENHOE DAM HYDROLOGY REPORTS

The reports contained in the following listing can be used to show that a flood event similar in magnitude and circumstances to the January 2011 Flood Event would be expected to result in urban damage below Moggill if both Wivenhoe Dam and Somerset Dam are operated under their current full supply levels.

When examining these reports it is important to understand that the January 2011 Flood Event is defined by its peak flow of 12000 m³/s and its volume of 2,650,000 megalitres. The AEP of the event cannot be generally be reconciled across all of the listed reports for the following three reasons:

- The accepted techniques for estimating design rainfall and flood AEP information have been changed on five occasions since 1977. Modelling techniques have also changed and this also impacts on AEP estimations.
- Across the listed reports the implied AEP for the January 2011 Flood Event ranges between 1 in 200 and 1 in 2000.
- The January 2011 Flood Event is represented by two individual floods, with peak inflows from each flood greater than 10000 m³/s, separated by 30 hours. The probability of two such flood peaks occurring within 36 hours of each other is considered to be appreciably uncommon and would impact on the AEP of the event.
- An event with a hydrograph similar to the January 2011 Flood Event has not been modeled in any report listed. This is because reports consider idealised storms and historical events and an event similar in nature to the January 2011 Flood Event has never been recorded.
